Foreword

- This document is aimed at all healthcare workers delivering care to all patients in all settings.

- This document is adapted from the *Guideline for Isolation Precautions: Preventing Transmission of Infectious Agents in Healthcare Settings, 2007* published by the Centre of Disease Control (http://www.cdc.gov/ncidod/dhqp/pdf/guidelines/Isolation2007.pdf)

- Each healthcare facility (including community care areas) must develop local guidelines on Standard Precautions, using if desired this document as a template.
1. Introduction

1.1 What are Standard Precautions?

Standard Precautions require all HCW’s to:

a. assume that every person is potentially infected or colonized with an organism that could be transmitted in the healthcare setting.

b. apply a set of work practices to blood, all body fluids except sweat, mucous membranes and non intact skin including:

- hand hygiene
- use of personal protective equipment
- management of spillages of blood and body fluids
- appropriate patient placement
- management of sharps
- safe injection practices
- respiratory hygiene and cough etiquette
- management of needle stick injuries
- management of waste
- management of laundry
- decontamination of reusable medical equipment
- decontamination of the environment.

1.2 What is the rationale for Standard Precautions?

Within a healthcare setting both patients and healthcare staff are at risk of acquiring an infection

Risk to Patients

It has been estimated that 1 in 10 patients acquire a healthcare associated infection (HCAI) (PHLS 1995)

Risk to Healthcare staff

Infection is an occupational risk for healthcare staff. Exposure to blood and body fluids from infected patients poses a risk of infection with hepatitis B, C or HIV for healthcare staff (Cloeren, M 1998)
1.3 **How is infection transmitted?**

Transmission of infection occurs when the 6 elements of the “Chain of Infection” are present.

1.3.1 **Chain of Infection (see figure 1)**

The chain of infection is a way of describing how disease is transmitted from one living thing to another.

1. **Infectious agent**
   
   An infectious agent is an organism that causes disease:
   
   - bacteria
   - viruses
   - fungi
   - protozoa
   - prions
   
   There are two sources of infection:

   **A.** endogenous or self infection occurs when organisms which are harmless in one site cause infection when transferred to another e.g. E coli.
   **B.** exogenous or cross infection occurs when organisms are transferred from another source e.g. nurse, doctor, other patient, the environment.

2. **Reservoirs**
   
   A reservoir is a place where an infectious agent lives and grows (e.g. large intestine, blood, mouth)

3. **Portal of exit**
   
   A portal of exit is any body opening that allows the infectious agent to leave (e.g. mouth, nose, rectum, breaks in the skin,)

4. **Means of transmission**
   
   The means of transmission is how the infectious agent travels from the infected person to another person e.g. air, contact (indirect and direct)

5. **Portal of entry**
   
   The portal of entry is any body opening that allows the infectious agent to enter (e.g. nose, mouth, eyes, mucous membranes, a break in the skin, a device inserted into the skin etc)

6. **A susceptible host**
   
   A susceptible host is a non infected person who could get infected.
The purpose of Standard Precautions is to break the chain of infection focusing particularly but not exclusively on the mode of transmission, portal of entry and susceptible host sections of the chain.

Aseptic technique and antibiotic prophylaxis while not components of Standard Precautions are other key practices used to break the Chain of Infection at the infectious agent, reservoir and portal of exit sections of the chain.
1.4 Standard Precautions and the Chain of Infection
While the implementation of Standard Precautions breaks the chain of infection thus minimising transmission of infection within the Healthcare environment some highly transmissible infections required additional precautions to Standard Precautions. These additional precautions are Transmission-based Precautions.

1.4.1 Transmission-Based Precautions
Transmission-based Precautions are Contact, Airborne and Droplet Precautions

- **Contact Precautions**
Contact precautions should be applied in addition to Standard Precautions to prevent transmission of highly transmissible organisms that are transmitted from person to person via the contact route (e.g. Meticillin resistant *Staphylococcus aureus*)

- **Airborne Precautions**
Airborne Precautions should be applied, in addition to Standard Precautions, to prevent transmission of highly transmissible organisms that are transmitted via the air from one person to another (e.g. Tuberculosis)

- **Droplet Precautions**
Droplet Precautions should be applied, in addition to Standard Precautions, to prevent transmission of highly transmissible organisms that are transmitted via respiratory secretions from one person to another (e.g. Influenza)
1.5 Responsibilities

1.5.1 Healthcare workers

All healthcare workers are responsible for:

- implementing Standard Precautions at all times
- attending induction and ongoing training on Standard Precautions
- reporting any deficits in knowledge or resources to line managers
- reporting any illness as a result of occupational exposure
- not attending for duty with known or suspected infection without first informing occupational Health department
- advising visitors of infection prevention and control requirements such as hand hygiene and cough etiquette

1.5.2 Managers of Healthcare facilities

Managers of Healthcare facilities are responsible for ensuring that the resources necessary to implement Standard Precautions are provided including:

- an infection prevention and control service
- an occupational health service
- an infection prevention and control induction programme for new staff
- an ongoing infection prevention and control education programme for staff
- equipment (e.g. personal protective equipment, cleaning equipment)
- physical infrastructure (isolation rooms, hand wash sinks etc)
- development of an action plan to address any non compliance with Standard Precautions identified by regular audits (see 1.5.3)

1.5.3 Infection Prevention and Control staff

Infection Prevention and Control staff are responsible for;

- providing education on Standard Precautions to all staff
- ensuring local guidelines and policies on Standard and Transmission- based Precautions are in place and regularly reviewed
- surveillance of epidemiology important organisms and notifiable diseases
- providing ongoing advice to staff
- auditing implementation of Standard and Transmission-based Precautions in conjunction with relevant department/ward areas (e.g. ward/hygiene managers) and feedback results to department/ward managers and healthcare managers (see 1.5.2)
2.0 Clinical work Practices in Standard Precautions

The following pages (10-18) describe the Clinical Work Practices in Standard Precautions in detail.

A table with 4 columns has been used to present the information (see table 1).

- **Column 1**
  The format number
- **Column 2**
  The name of the clinical work practice
- **Column 3**
  A description of the clinical work practice that applies in Standard Precautions. References to other Irish publications and web sites that are relevant are included.
- **Column 4**
  A graphic description of where the clinical work practice breaks the chain of infection

| **2.1** Occupational Health Programme | All HCW’s should be assessed by an occupational health team prior to commencing work. This assessment should include:  

| **2.2** PATIENT PLACEMENT | HCW’s should include the potential for transmission of infectious agents in patient placement decisions  
Where possible, place patients who contaminate the environment or cannot maintain appropriate hygiene in isolation rooms with en suite toilet facilities and ante room | ![Diagram](https://via.placeholder.com/150) |
| **2.3** HAND HYGIENE | Hand hygiene is recommended;  
- before and after each episode of patient contact  
- between individual patient contacts  
- after contact with blood, body fluids, secretions or excretions, whether or not gloves are worn  
- after handling soiled/contaminated equipment, materials or the environment  
- immediately after removing gloves or other protective clothing (see 2.6)  

Hands may be decontaminated using both plain soap and water or if hands are physically clean, an alcohol based hand rub/gel  
Patients should wash their hands after toileting and before meals. HCW should assist those patients unable to perform hand hygiene independently.

</tbody>
</table>

### 2.7 Environmental Decontamination

Routine environmental cleaning is required to minimise the number of micro-organisms in the environment.

Particular attention should be given to frequently touched surfaces and those most likely to be contaminated with blood or body fluids e.g. bedrails, mattress, bedside tables, commodes, doorknobs, sinks, surfaces and equipment close to the patient.

Chemical disinfectants are not recommended for routine environmental cleaning.

When using disinfectants, staff should follow the manufacturer’s instructions for dilution and contact times.

### 2.8 Patient Care Equipment & Decontamination of Medical Devices:

Medical devices designated as “Single Use Only” must not be reprocessed or reused under any circumstances (MDA DB 2000), (MDD) 93/42/EEC

**Non Critical equipment**

Non critical equipment refers to equipment that is either not in contact with a patient or in contact with healthy skin. Such equipment should be:

- in a state of good repair in order to facilitate effective cleaning.
- must be thoroughly cleaned prior to use on another patient/resident. If soiled with blood or body fluids, disinfect using a chlorine-releasing solution of 1000ppm, or equivalent according to manufacturers’ instructions, rinse and dry.

**Reusable Invasive Medical Devices (RIMD)**

RIMD refers to equipment that is classified as semi critical or critical. RIMD’s are in contact with sterile body sites, mucus membranes, breaks in the skin. HCW’s must ensure that RIMD’s are not used for another patient until it has been cleaned and reprocessed appropriately.

(HSE Code of Practice for Decontamination of Reusable Invasive Medical Devices 2007)

</table>
| **2.9** Management of Health Care Risk Waste | Dispose of healthcare risk waste in accordance with the Department of Health & Children's (DoHC) Guidelines for Waste Disposal, which outlines the categorisation and segregation of health care waste. Disposal of sharps;  
- syringes and needles should be disposed of as a single unit.  
- used sharps should be carefully discarded into designated sharps containers at the point of use.  
- sharps boxes should be securely stored out of reach of clients, visitors and children  
- needles should not be re-capped, bent, broken or disassembled.  
- sharps should not be passed from person to person by hand.  

| **2.10** Management of needle stick injuries (NSI) and blood and body fluid exposure | All facilities must have a local guideline on the management of needle stick injuries and blood and body fluid exposure. This guideline should include;  
- First aid  
- Risk assessment and screening of source patient (if known)  
- Risk assessment for chemoprophylaxis  
- Counseling and follow up testing

</thead>
</table>
| **2.12** | Spillages of blood, urine, faeces or vomit should be dealt with immediately wearing protective clothing (see 2.6). For spillages of body fluid (e.g. urine, faeces or vomit);  
- soak up as much of the visible material as possible with disposable paper towels.  
- dispose of the soiled paper towels according to national guidelines (see 2.9)  
- clean the area using warm water and general purpose neutral detergent.  
- disinfect using a chlorine-releasing solution of 1000ppm, or equivalent according to manufacturers' instructions, rinse and dry.  
- discard gloves and apron according to national guidelines (see 2.9)  
- decontaminate hands (see 2.3)  
- do not apply chlorine-based disinfectants directly onto spillages of urine as it may result in the release of chlorine vapour.  
For blood spillages;  
- decontaminate all blood spills with a chlorine based disinfectant (e.g. powder, granules or liquid containing 10,000ppm available chlorine) or suitable alternative, in line with the manufacturer’s instructions and local policy  
- wipe up the spillage with disposable paper towels and discard into a yellow healthcare risk bag or rigid container (see 2.9)  
- Wash the area with a general purpose neutral detergent and water.  
- discard gloves and apron into healthcare risk bag  
- decontaminate hands (see 2.3) |
<table>
<thead>
<tr>
<th>Clinical Work Practice</th>
<th>STANDARD PRECAUTIONS</th>
<th>Breaking the Chain of Infection</th>
</tr>
</thead>
</table>
| **2.13** Safe Injection Practices | Administration  
Educate all HCW’s who administer injections on the importance of safe injection practices  
All facilities should have a guideline on the use of multiple dose vials | | |
| | Preparation of Injections  
All injections should be prepared in a clean area. This area must not be used for disposing of used needles and syringes, handling blood samples, or any material contaminated with blood or body fluids  
An aseptic technique must be used when drawing up injections  
Needles, syringes and cannulae are sterile, single use items; they must not be reused for another patient nor to access a medication or solution that might be used for a subsequent patient  
Use single dose vials wherever possible  
Do not use single dose vials for multiple patients  
Do not combine left over’s for later use  
Wear a surgical mask when placing a catheter or injecting material into the spinal canal or subdural space | | |
| | Multiple vials  
Multiple dose vials should only be used when absolutely necessary  
Restrict wherever possible the use of multiple dose vials to a single patient  
Label vial with patients name and date opened  
Discard if sterility is compromised or questionable  
Do not leave multiple dose vials at a patient’s bedside  
Use a sterile syringe and needle every time a medication vial is accessed even it is a 2nd dose of the same drug for the same patient | | |
| | Infusions and intravenous sets  
Do not use bags or bottles of intravenous fluids as a common source of supply for multiple patients  
Intravenous fluids and intravenous sets are single use sterile items for use by a single patient  
Consider a syringe or needle/cannula contaminated once it has been used to enter or connect to a patients’ intravenous infusion bag or administration set. | | |

Appendix A

Respiratory Hygiene and Cough Etiquette

When coughing or sneezing use a tissue to cover your nose and mouth

Dispose of the tissue afterwards in a waste bin

Decontaminate your hands after discarding tissue using soap and water or alcohol gel

These 3 steps will help prevent the spread of respiratory infections
