APPENDIX 3B PNEUMONIA ALGORITHMS 43
PREVALENCE SURVEY DESIGN

This manual contains the protocol for the prevalence survey of healthcare-associated infections (HCAI) in acute hospitals. This protocol has been adapted from Version 1.2 of the United Kingdom (UK) protocol, which was amended after a pilot in a number of hospitals in the UK using an earlier version of the protocol (1.1).

The study has been designed as a point prevalence survey. This means that, in an ideal world, the information should be completed for the whole hospital on a single day. Completion of the survey on a single day is probably not feasible even for the smallest centres; therefore at least one ward should be completed on a single day and the overall hospital as soon as possible within the 12 week study period (1st March 2006 to May 30th 2006).

CHARACTERISTICS OF THE PREVALENCE SURVEY

Data will be collected on all active HCAI (as defined by the CDC definitions of nosocomial infections, Appendix 3) present on the date of survey. Each centre should designate a member of the hospitals infection control team (ICT) to be in charge of the study. This person must ensure the collaboration of the clinical staff as well as hospital management. In addition this person will lead the data collection team, liaise with the Health Services Executive (HSE) support team (i.e. one nurse and one data collector, the nurse is not an infection control nurse) regarding dates of sampling and introduce them to relevant ward staff in order to facilitate data collection.

Patient’s notes and other healthcare records need to be available to carry out the survey. Therefore if a patient is in a bed, but not clerked, they should not be included in the survey. If a patient is in a diagnostic unit when the survey is done in their area and they return before the ward is finished they should be included, but otherwise there is no requirement to return to a ward to include missing patients. If a patient is surveyed and transferred to another ward and knowingly encountered a second time, the patient should not be re-surveyed.

POPULATION

Patients of all consultant specialties will be included except for paediatric patients, rehabilitation patients, psychiatric and day-case patients. Do not include patients in the survey from the following patient groups:

- Patients on a psychiatry ward, that is, a ward providing care for patients whose primary condition is psychiatric.
- Patient on a rehabilitation ward, that is, a ward for patients whose primary reason for hospitalisation is to receive physical therapy or rehabilitative therapy.
- Patients whose primary reason is not an acute illness, such as those in skilled nursing care or domiciliary sections of the hospital.
- Patients undergoing outpatient surgery also called day surgery or same day surgery.
- Patients seen as outpatients, whether for observation, diagnosis, or therapy (e.g. chemotherapy, dialysis, or cardiac catheterisation).
- Patients in the Emergency Department, this includes ‘trolley-waits’.
**DATA COLLECTION**

**How?**

The questionnaires should be completed using black/blue ink or ball-point pen, and items have been designed to be completed by placing an \textbf{X} within a box or writing numeral(s) in appropriate boxes.

**When?**

Monday to Friday 9am – 5pm. However, in some units more patients are admitted on Monday for elective procedures. Because this might influence the results, and in order to avoid or at least to minimise bias regarding daily variation, our recommendation is to perform the survey in these units between Tuesday and Friday if possible.

**How long?**

The information should be completed for each ward/unit \textbf{in a single day}.

**What is a healthcare-associated infection (HCAI)?**

A healthcare-associated (or nosocomial) infection is a localised or systemic condition resulting from an adverse reaction to the presence of an infectious agent(s) or its toxins that meet the following criterion:

\textbf{It occurs in the survey population} and

\textbf{There is no evidence that it was present or incubating at the time of admission to this hospital unless the infection was related to a previous admission to this hospital (i.e. the hospital under surveillance)} and

\textbf{It meets the criteria for a specific infection site as defined in Appendix 3.}

“For most bacterial nosocomial infection, this means that the infection usually becomes evident 48 hours (i.e., the typical incubation period) or more after admission.”

**What infections will be collected?**

- The infections collected will be HCAI active at the time of the survey.
- All active HCAI will be recorded. Special emphasis is placed on four main system infections; primary bloodstream infections, pneumonia, urinary tract infections and surgical site infections. The four main system infections include a number of in-depth questions.

Healthcare-associated infections present on the day of the survey or HCAIs for which the patient is undergoing antimicrobial treatment on the day of the survey should be recorded.
Who will collect the data?

The UK pilot study indicated that a team of three persons was the most efficient way to collect the survey data: these teams comprised a clinical microbiologist, and infection control nurse (ICN) and another individual that completed the survey form as instructed by the microbiologist and the ICN.

In the Republic of Ireland, due to the lack of consultant clinical microbiologists in many institutions, the composition of the team responsible for data collection will vary from one hospital to another. Nonetheless, infection control personnel of the hospital concerned including a clinical microbiologist if present, should be predominantly involved in this study. A designated member of the hospitals ICT will lead the survey in that institution. This person will be assisted by members of the local ICT and HSE support team. In some institutions, the HSE data collector only will be required to complete the suggested team of three. However in many institutions both the HSE data collector and HSE nurse will be required. The role of the team in charge of the patients should also be emphasised.

Confidentiality

The anonymity of patients must be assured by the local ICT’s responsible for the study. The questionnaires contain no patient identifiable information. The data extracted will be anonymised before transmission to the Health Protection Surveillance Centre (HPSC), therefore it will not be possible to identify an individual patient from the information transmitted. In addition, HSE data collectors and nurses will have signed confidentiality agreements.

In the UK, it has been confirmed that ethical approval for this survey is not required. In Ireland, the HSE has confirmed that ethical approval is not required in Ireland either.

Questionnaire

The questionnaire is designed to facilitate the task of data collection. It is contained on both sides of an A4 sheet (Pages 7&8).

There are two kinds of responses:

1. Questions with the options YES/NO and Male/Female should be answered by placing an X in the appropriate box.

2. A number of questions require numerical codes:
   - Each centre/hospital will have its own identifying code. The codes for participating hospitals will be supplied by the HSE data collectors.
   - The designated ICT member for that institution will determine local ward codes. This is to facilitate local ICT’s in interpreting survey results in their own institution.
   - Each specialty is categorised and will have its own identifying codes listed in Appendix 1.
   - Surgical intervention categories (NHSN procedure categories) are listed in Appendix 2.
Prevalence survey of healthcare associated infections

Please write inside number and date frames or enter [X] in the appropriate box
DO NOT USE A PHOTOCOPY - Each form is uniquely serialised

Survey details
- Hospital
- Date of survey
- Consultant specialty
- Ward specialty
- Local ward identifier

Patient details
- Sex: Male, Female
- Age
- Date of admission

Indwelling urinary catheter in-situ
- Yes
- No
- Urinary catheter within last 7 days

Other bladder instrumentation in-situ
- Yes
- No
- Other bladder instrumentation within last 7 days

Peripheral intravascular catheter in-situ
- Yes
- No
- Peripheral intravascular catheter within last 7 days

Central Intravascular catheter in-situ
- Yes
- No
- Central intravascular catheter within last 7 days

Mechanical ventilation
- Yes
- No
- Mechanical ventilation within last 7 days

Parenteral nutrition
- Yes
- No
- Parenteral nutrition within last 7 days

Currently receiving systemic antibodies
- Yes
- No
- IV antibiotics

Surgery within last 30 days with no implant
- Yes
- No
- Procedure category

Surgery within last year involving an implant
- Yes
- No
- Procedure category

Other invasive procedure

Other information
- Current confirmed/suspected norovirus
- Current C. difficile diarrhoea

Active healthcare-associated infections
- Any healthcare-associated infections?
- Yes
- No
- If 'No' this form is now completed.
- If 'Yes', complete infection-related questions overleaf

TERMS USED

Indwelling urinary catheter:
A drainage tube that is inserted into the urinary bladder through the urethra, is left in place, and is connected to a closed collection system; also called a Foley catheter. Do not include intermittent catheterisation.

Other bladder instrumentation:
Bladder instrumentation other than indwelling urinary catheter (i.e. intermittent catheterisation, urethral dilation, bladder irrigation, cystoscopy, cystourethrography, or suprapubic catheterisation).

Central intravascular catheter:
Vascular access device that terminates at or close to the heart or in one of the great vessels, i.e.

<table>
<thead>
<tr>

<th>Inferior vena cava</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brachiocephalic vein</td>
<td>Internal jugular vein</td>
<td>Subclavian vein</td>
</tr>
<tr>
<td>Pulmonary artery</td>
<td>External iliac vein</td>
<td>Common femoral vein</td>
</tr>
</tbody>
</table>

Peripheral intravascular catheter:
Vascular access device in place in a peripheral vessel (usually in the hands, wrists, or arms) including peripherally inserted arterial lines.

Ventilator:
A device to assist or control respiration continuously through a tracheostomy or by endotracheal intubation. NOTE: Lung expansion devices such as intermittent positive pressure breathing; nasal positive expiratory pressure; continuous nasal positive airway pressure are not considered ventilators unless delivered via tracheostomy or endotracheal intubation.

Parenteral nutrition:
Nutrients provided intravenously.

Secondary bloodstream infection:
The patient has a culture-confirmed bloodstream infection and a related HCAI at another site. An exception is when a vascular access device is present and no other infection site is evident; then the bloodstream infection is considered a primary bloodstream infection.

Implant:
A nonhuman-derived implantable foreign body (e.g., prosthetic heart valve, hip prosthesis) that is permanently placed in a patient during an operative procedure and is not routinely manipulated for diagnostic or therapeutic purposes. Screws, wires, and mesh that are left in place are considered implants.
**Current confirmed/suspected Norovirus:**

Patient is either proven Norovirus or epidemiologically linked in time and place to one proven case. This includes patients currently under treatment or in isolation (including cohorting) for Norovirus infection.

**Current *C. difficile* diarrhoea:**

Patient has diarrhoea which is positive for *C difficile* toxin.

**Operative procedure:**

A procedure:

- That is performed on a patient included in prevalence survey
- Takes place in an operating room (may include an operating room, c-section room, interventional radiology room, or cardiac catheterisation lab);
- Takes place during an operation (defined as a single trip to the operating room where a surgeon makes at least one incision through the skin or mucous membrane, including laparoscopic approach, and closes the incision before the patient leaves the operating room);
- That is included in Table 3, page 18 (NHSN Operative Procedure Categories).

Note: The National Healthcare Safety Network (NHSN) is an internet application that replaced National Nosocomial Infection Surveillance (NNIS) System (CDC, Atlanta) on 1st October 2005.

**Procedure category:**

Combinations of clinically similar operative procedures.

**Other invasive procedure:**

Procedures that do not meet the criteria for a NHSN operative procedure (Table 3). This principally include procedures:

- performed outside the operating room;
- involving no incision e.g. bronchoscopy, gastroscopy;
- skin or mucous membrane incision but no closure, e.g. debridement;
- diagnostic procedure, aspiration, injection or catheterisation;
- not included in NHSN operative procedure categories.

APPENDIX 1. CONSULTANT AND WARD SPECIALTY CODES

MAIN SPECIALTY CODES are aligned with the specialties recognised in the European Specialist Medical Qualifications Order 1995 and European Primary and Specialist Dental Qualifications Regulations 1998.

Joint Consultant Clinic activity should be recorded against the CONSULTANT SPECIALTY CODE of the CONSULTANT managing the patient on a day to day basis.

Table 2. Consultant and ward specialty codes

</tbody>
</table>
Table 4. Principle Operative Procedure Selection Lists

- If more than one NHSN operative procedure was performed through a single incision, attempt to determine the procedure that is thought to be associated with the infection.
- If it is not clear (as is often the case when the infection is a superficial incisional SSI) use the NHSN Principal Operative Procedure Selection Lists below to select which operative procedure to report.
- The operative procedures with the highest risk of surgical site infection are listed before those with a lower risk.
- Therefore if two procedures are carried out, check which procedure has the highest priority (see below) and then use the code appropriate for that procedure according to Table 3.

The following lists are derived from Table 3, NHSN Operative Procedure Categories.

APPENDIX 3  CDC DEFINITIONS OF NOSOCOMIAL INFECTIONS

Criteria for determining the site of a Healthcare-Associated Infection

Introduction

Before an infection is reported, the person performing surveillance must decide that the clinical, laboratory, and other diagnostic information gathered on the patient satisfy the criteria for a HCAI.

To assist surveillance personnel in making these decisions consistently, this section contains a listing of the major and specific infection sites used and the criteria for determining the presence of an infection at each of the specific sites.

While all participants may not agree with all the criteria, it is important that hospitals consistently use them for reporting infections so rates can be appropriately aggregated and compared.

General Information

Any infection reported must meet the definition of infection of a HCAI, that is, a localised or systemic condition resulting from adverse reaction to the presence of an infectious agent(s) or its toxins. There must be no evidence that it was present or incubating at the time of hospital admission unless the infection was related to a previous admission to this hospital (i.e. the hospital under surveillance).

Two terms are used to describe infection sites: major sites of infection and specific sites of infection. Specific sites of infection are the infection sites for which criteria have been developed. Specific sites of infection have been grouped into 13 major site categories to facilitate data analysis. For example, there are three specific sites (or types) of urinary tract infections:

- Symptomatic urinary tract infection;
- Asymptomatic bacteriuria;
- Other infections of the urinary tract;

these are grouped under the major site of Urinary Tract Infection.

For the purposes of the prevalence survey all system infections will be identified at major site level. Only urinary tract infections, surgical site infections, pneumonia and primary bloodstream infections will be identified to specific site level. For example a deep incisional surgical site infection will be recorded as a surgical site infection (Major site) and as a deep incisional surgical site infection (specific site); whereas an Endocarditis (Specific site) or Mediastinitis (Specific site) will be recorded only as Cardiovascular System Infection (Major site).

</tbody>
</table>

**Major Infection Site: PRIMARY BLOODSTREAM INFECTION (Laboratory-confirmed)**

**DEFINITION:** Primary bloodstream infection (Laboratory-confirmed) must meet at least one of the following criteria:

**Criterion 1:**
Patient has a recognised pathogen cultured from one or more blood cultures and organism cultured from blood is **not** related to an infection at another site.

**Criterion 2:**
Patient has at least one of the following signs or symptoms: fever (>38°C), chills, or hypotension and at least one of the following:

a. Common skin contaminant (e.g., diphtheroids, *Bacillus* sp., *Propionibacterium* sp., coagulase-negative staphylococci, or micrococci) is cultured from two or more blood cultures drawn on separate occasions

b. Common skin contaminant (e.g., diphtheroids, *Bacillus* sp., *Propionibacterium* sp., coagulase-negative staphylococci, or micrococci) is cultured from at least one blood culture from a patient with an intravascular line, and the physician institutes appropriate antimicrobial therapy

c. Positive antigen test on blood (e.g., *Haemophilus influenzae*, *Streptococcus pneumoniae*, *Neisseria meningitidis*, or group B *Streptococcus*) and signs and symptoms and positive laboratory results are **not** related to an infection at another site.

**REPORTING INSTRUCTIONS:**

- Report purulent phlebitis confirmed with a positive culture of a catheter tip, but with either negative or no blood culture, as Cardiovascular System Infection.

- Pseudobacteraemias are not nosocomial infections.

**NOTE:**
PNEUMONIA DEFINITIONS ARE IN APPENDICIES 3A & 3B (PAGES 43 – 48)
Major Infection Site: URINARY TRACT INFECTION

COMMENTS:
- A positive culture of a urinary catheter tip is not an acceptable laboratory test to diagnose either a urinary tract infection or bacteriuria.
- Urine cultures must be obtained using appropriate technique, such as clean catch collection or catheterisation.

Specific site: Symptomatic urinary tract infection

DEFINITION: Symptomatic urinary tract infection must meet at least one of the following criteria:
Criterion 1:
- Patient has at least one of the following signs or symptoms with no other recognised cause: fever (>38°C), urgency, frequency, dysuria, or suprapubic tenderness
- Patient has a positive urine culture, that is, \( \geq 10^5 \) microorganisms per cm\(^3\) of urine with no more than two species of microorganisms.

Criterion 2:
- Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), urgency, frequency, dysuria, or suprapubic tenderness
- At least one of the following:
  a. Positive dipstick for leukocyte esterase and/or nitrate
  b. Pyuria (urine specimen with \( \geq 10 \) WBC/mm\(^3\) or \( \geq 3 \) WBC/high power field of unspun urine)
  c. Organisms seen on Gram stain of unspun urine
  d. At least two urine cultures with repeated isolation of the same uropathogen (gram-negative bacteria or \( S. saprophyticus \)) with \( \geq 10^2 \) colonies/mL in nonvoided specimens
  e. \( \leq 10^5 \) colonies/mL of a single uropathogen (gram-negative bacteria or \( S. saprophyticus \)) in a patient being treated with an effective antimicrobial agent for a urinary tract infection
  f. Physician diagnosis of a urinary tract infection
  g. Physician institutes appropriate therapy for a urinary tract infection

Specific site: Asymptomatic bacteriuria

DEFINITION: An asymptomatic bacteriuria must meet at least one of the following criteria:
Criterion 1:
- Patient has had an indwelling urinary catheter within 7 days before the culture
- Patient has a positive urine culture, that is, \( \geq 10^5 \) microorganisms per cm\(^3\) of urine with no more than two species of microorganisms
- Patient has no fever (>38°C), urgency, frequency, dysuria, or suprapubic tenderness.

Criterion 2:
- Patient has not had an indwelling urinary catheter within 7 days before the first positive culture
- Patient has had at least two positive urine cultures, that is, \( \geq 10^5 \) microorganisms per cm\(^3\) of urine with repeated isolation of the same microorganism and no more than two species of microorganisms
- Patient has no fever (>38°C), urgency, frequency, dysuria, or suprapubic tenderness.
Specific site: Other infections of the urinary tract

**DEFINITION:** Other infections of the urinary tract (kidney, ureter, bladder, urethra, or tissues surrounding the retroperitoneal or perinephric spaces) must meet at least one of the following criteria:

Criterion 1:
- Patient has organisms isolated from culture of fluid (other than urine) or tissue from affected site.

Criterion 2:
- Patient has an abscess or other evidence of infection seen on direct examination, during a surgical operation, or during a histopathological examination.

Criterion 3:
- Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), localised pain, or localised tenderness at the involved site and at least one of the following:
  a. Purulent drainage from affected site
  b. Organisms cultured from blood that are compatible with suspected site of infection
  c. Radiographic evidence of infection, for example, abnormal ultrasound, computed tomography (CT), magnetic resonance imaging (MRI), or radiolabel scan (gallium, technetium)
  d. Physician diagnosis of infection of the kidney, ureter, bladder, urethra, or tissues surrounding the retroperitoneal or perinephric space
  e. Physician institutes appropriate therapy for an infection of the kidney, ureter, bladder, urethra, or tissues surrounding the retroperitoneal or perinephric space
**Major Infection Site:** SURGICAL SITE INFECTION

**NOTE:**
- **Surgical site infections should only be recorded in the hospital where the procedure was performed. Therefore if the patient under surveillance has a surgical site infection but the procedure was performed in another hospital it is NOT recorded as a surgical site infection in this prevalence survey.**
- If more than one NHSN operative procedure was performed through a single incision, attempt to determine the procedure that is thought to be associated with the infection.
- If it is not clear (as is often the case when the infection is a superficial incisional SSI) use the NHSN Principal Operative Procedure Selection Lists (Table 4) to select which operative procedure to report.
- If a patient has several NHSN operative procedures prior to an infection, report the operative procedure code of the operation that was performed most closely in time prior to the infection date, unless there is evidence that the infection is associated with a different operation.

**Specific site:** Superficial incisional surgical site infection

**DEFINITION:** A superficial SSI must meet the following criteria:

- Infection occurs within 30 days after the operative procedure
- involves only skin and subcutaneous tissue of the incision
- patient has at least one of the following:
  - a. Purulent drainage from the superficial incision
  - b. Organisms isolated from an aseptically obtained culture of fluid or tissue from the superficial incision
  - c. At least one of the following signs or symptoms of infection:
    - a. pain or tenderness, localised swelling, redness, or heat, and superficial incision is deliberately opened by surgeon, unless incision is culture-negative
    - d. Diagnosis of superficial incisional SSI by the surgeon or attending physician

**REPORTING INSTRUCTIONS:**
- Do not report
  - a. a stitch abscess (minimal inflammation and discharge confined to the points of suture penetration) as an infection.
  - b. a localised stab wound infection as SSI; instead report as skin or soft tissue infection, depending on its depth.
- Episiotomy is not an NHSN operative procedure. Report infection of the episiotomy site as Reproductive Tract Infection.
- Report infected burn wound as Skin and Soft Tissue Infection.
- If the incisional site infection involves or extends into the fascial and muscle layers, report as a deep incisional SSI.
- Classify infection that involves both superficial and deep incision sites as deep incisional SSI.
**Specific site: Deep incisional surgical site infection**

**DEFINITION:**
A deep incisional SSI must meet the following criteria:

- Infection occurs within 30 days after the operative procedure if no implant is left in place or within 1 year if implant is in place and the infection appears to be related to the operative procedure and
- involves deep soft tissues (e.g., fascial and muscle layers) of the incision and
- patient has at least one of the following:
  a. Purulent drainage from the deep incision but not from the organ/space component of the surgical site
  b. A deep incision spontaneously dehisces or is deliberately opened by a surgeon when the patient has at least one of the following signs or symptoms: fever (>38°C) or localised pain or tenderness, unless incision is culture-negative
  c. An abscess or other evidence of infection involving the deep incision is found on direct examination, during reoperation, or by histopathological or radiological examination
  d. Diagnosis of a deep incisional SSI by a surgeon or attending physician

**REPORTING INSTRUCTIONS:**
- Classify infection that involves both superficial and deep incision sites as deep incisional SSI.

**Specific site: Organ/space surgical site infection**

**DEFINITION:** An organ/space SSI involves any part of the body, excluding the skin incision, fascia, or muscle layers, that is opened or manipulated during the operative procedure. An example is appendectomy with subsequent subdiaphragmatic abscess.

An organ/space SSI must meet the following criteria:

- Infection occurs within 30 days after the operative procedure if no implant is left in place or within 1 year if implant is in place and the infection appears to be related to the operative procedure and
- infection involves any part of the body, excluding the skin incision, fascia, or muscle layers, that is opened or manipulated during the operative procedure and
- patient has at least one of the following:
  a. Purulent drainage from a drain that is placed through a stab wound into the organ/space
  b. Organisms isolated from an aseptically obtained culture of fluid or tissue in the organ/ space
  c. An abscess or other evidence of infection involving the organ/space that is found on direct examination, during reoperation, or by histopathological or radiological examination
  d. Diagnosis of an organ/space SSI by a surgeon or attending physician

**REPORTING INSTRUCTIONS:**
- Occasionally, an organ/space infection drains through the incision. Such infection generally does not involve reoperation and is considered a complication of the incision. Therefore, it is classified as a deep incisional SSI.
Major Infection Site: BONE AND JOINT INFECTION

Specific site: Osteomyelitis

*DEFINITION:* Osteomyelitis must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from bone.
- **Criterion 2:** Patient has evidence of osteomyelitis on direct examination of the bone during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), localised swelling, tenderness, heat, or drainage at suspected site of bone infection and at least one of the following:
  - a. Organisms cultured from blood
  - b. Positive blood antigen test (e.g., *H. influenzae*, *S. pneumoniae*)
  - c. Radiographic evidence of infection, for example, abnormal findings on x-ray, CT, MRI, radiolabelled scan (gallium, technetium, etc.)

Specific site: Joint or bursa

*DEFINITION:* Joint or bursa infections must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from joint fluid or synovial biopsy.
- **Criterion 2:** Patient has evidence of joint or bursa infection seen during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has at least two of the following signs or symptoms with no other recognised cause: joint pain, swelling, tenderness, heat, evidence of effusion or limitation of motion and at least one of the following:
  - a. Organisms and white blood cells seen on Gram stain of joint fluid
  - b. Positive antigen test on blood, urine, or joint fluid
  - c. Cellular profile and chemistries of joint fluid compatible with infection and not explained by an underlying rheumatologic disorder
  - d. Radiographic evidence of infection, for example, abnormal findings on x-ray, CT, MRI, radiolabelled scan (gallium, technetium, etc.)

Specific site: Disc space

*DEFINITION:* Vertebral disc space infection must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from vertebral disc space tissue obtained during a surgical operation or needle aspiration.
- **Criterion 2:** Patient has evidence of vertebral disc space infection seen during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has fever (>38°C) with no other recognised cause or pain at the involved vertebral disc space and radiographic evidence of infection, e.g., abnormal findings on x-ray, CT, MRI, radiolabelled scan with gallium or technetium.
- **Criterion 4:** Patient has fever (>38°C) with no other recognised cause and pain at the involved vertebral disc space and positive antigen test on blood or urine (e.g., *H. influenzae*, *S. pneumoniae*, *N. meningitidis*, or group B *Streptococcus*)
**Major Infection Site:** Central Nervous System Infection

**Specific site:** Intracranial infection  
(brain abscess, subdural or epidural infection, encephalitis)

**DEFINITION:** Intracranial infection must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from brain tissue or dura.
- **Criterion 2:** Patient has an abscess or evidence of intracranial infection seen during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has at least two of the following signs or symptoms with no other recognised cause: headache, dizziness, fever (>38°C), localising neurological signs, changing level of consciousness, or confusion  
  and  
  if diagnosis is made ante mortem, physician institutes appropriate antimicrobial therapy  
  and  
  at least one of the following:  
  a. Organisms seen on microscopic examination of brain or abscess tissue obtained by needle aspiration or by biopsy during a surgical operation or autopsy  
  b. Positive antigen test on blood or urine  
  c. Radiographic evidence of infection, for example, abnormal findings on ultrasound, CT, MRI, radionuclide brain scan, or arteriogram  
  d. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen

**Specific site:** Meningitis or ventriculitis

**DEFINITION:** Meningitis or ventriculitis must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from cerebrospinal fluid (CSF).
- **Criterion 2:** Patient has at least one of the following signs of symptoms with no other recognised cause: fever (>38°C), headache, stiff neck, meningeal signs, cranial nerve signs, or irritability  
  and  
  if diagnosis is made ante mortem, physician institutes appropriate antimicrobial therapy  
  and  
  at least one of the following:  
  a. Increased white cells, elevated protein and/or decreased glucose in CSF  
  b. Organisms seen on Gram stain of CSF  
  c. Organisms cultured from blood  
  d. Positive antigen test of CSF, blood, or urine  
  e. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen
Specific site: Spinal abscess without meningitis

**DEFINITION:** An abscess of the spinal epidural or subdural space, without involvement of the CSF or adjacent bone structures, must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from abscess in the spinal epidural or subdural space.
- **Criterion 2:** Patient has an abscess in the spinal epidural or subdural space seen during a surgical operation or at autopsy of evidence of an abscess seen during a histopathological examination.
- **Criterion 3:** Patient has at least one of the following signs or symptoms with no other recognised cause: fever (>38°C), back pain, focal tenderness, radiculitis, paraparesis, or paraplegia.

  if diagnosis is made ante mortem, physician institutes appropriate antimicrobial therapy.

  at least one of the following:

  a. Organisms cultured from blood
  b. Radiographic evidence of a spinal abscess, for example, abnormal findings on myelography, ultrasound, CT, MRI, or other scans (gallium, technetium, etc.)
Major Infection Site: Cardiovascular System Infection

Specific site: Arterial or venous infection

DEFINITION: Arterial or venous infection must meet at least one of the following criteria:

Criterion 1: Patient has organisms cultured from arteries or veins removed during a surgical operation and blood culture not done or no organisms cultured from blood.

Criterion 2: Patient has evidence of arterial or venous infection seen during a surgical operation or histopathological examination.

Criterion 3: Patient has at least one of the following signs or symptoms with no other recognised cause: fever (>38°C), pain, erythema, or heat at involved vascular size and more than 15 colonies cultured from intravascular cannula tip using semi quantitative culture method and blood culture not done or no organisms cultured from blood.

Criterion 4: Patient has purulent drainage at involved vascular site and blood culture not done or no organisms cultured from blood.

REPORTING INSTRUCTIONS:
- Report intravascular infections with organisms cultured from the blood as Primary Bloodstream Infection.

Specific site: Endocarditis involving either a natural or prosthetic heart valve

DEFINITION: Endocarditis of a natural or prosthetic heart valve must meet at least one of the following criteria:

Criterion 1: Patient has organisms cultured from valve or vegetation.

Criterion 2: Patient has two or more of the following signs or symptoms with no other recognised cause: fever (>38°C), new or changing murmur, embolic phenomena, skin manifestations (i.e., petechiae, splinter haemorrhages, painful subcutaneous nodules), congestive heart failure, or cardiac conduction abnormality and if diagnosis is made ante mortem, physician institutes appropriate antimicrobial therapy and at least one of the following:

a. Organisms cultured from two or more blood cultures
b. Organisms seen on Gram stain of valve when culture is negative or not done
c. Valvular vegetation seen during a surgical operation or autopsy
d. Positive antigen test on blood or urine (e.g., H. influenzae, S. pneumoniae, N. meningitidis, or group B Streptococcus)
e. Evidence of new vegetation seen on echocardiogram
Specific site: Myocarditis or pericarditis

**DEFINITION:** Myocarditis or pericarditis must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from pericardial tissue or fluid obtained by needle aspiration or during a surgical operation.
- **Criterion 2:** Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), chest pain, paradoxical pulse, or increased heart size and at least one of the following:
  - Abnormal electrocardiogram (ECG) consistent with myocarditis or pericarditis
  - Positive antigen test on blood (e.g., *H. influenzae, S. pneumoniae*)
  - Evidence of myocarditis or pericarditis on histological examination of heart tissue
  - Fourfold rise in type-specific antibody with or without isolation of virus from pharynx or faeces
  - Pericardial effusion identified by echocardiogram, CT, MRI, or angiography

Specific site: Mediastinitis

**DEFINITION:** Mediastinitis must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from mediastinal tissue or fluid obtained during a surgical operation or needle aspiration.
- **Criterion 2:** Patient has evidence of mediastinitis seen during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has at least one of the following signs or symptoms with no other recognised cause: fever (>38°C), chest pain, or sternal instability and at least one of the following:
  - Purulent discharge from mediastinal area
  - Organisms cultured from blood or discharge from mediastinal area
  - Mediastinal widening on x-ray
**Major Infection Site:**  
**Eye, Ear, Nose, Throat, or Mouth Infection**

**Specific site:**  
**Conjunctivitis**

*DEFINITION:* Conjunctivitis must meet at least one of the following criteria:

- **Criterion 1:** Patient has pathogens cultured from purulent exudate obtained from the conjunctiva or contiguous tissues, such as eyelid, cornea, meibomian glands, or lachrymal glands.

- **Criterion 2:** Patient has pain or redness of conjunctiva or around eye and at least one of the following:
  - a. WBCs and organisms seen on Gram stain of exudate
  - b. Purulent exudate
  - c. Positive antigen test [e.g., enzyme-linked immunosorbent assay (ELISA) or immunofluorescence (IF) for *Chlamydia trachomatis*, herpes simplex virus, adenovirus] on exudate or conjunctival scraping
  - d. Multinucleated giant cells seen on microscopic examination of conjunctival exudate or scrapings
  - e. Positive viral culture
  - f. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen

*REPORTING INSTRUCTIONS:*
- Do not report chemical conjunctivitis caused by silver nitrate (AgNO3) as a nosocomial infection.
- Do not report conjunctivitis that occurs as a part of a more widely disseminated viral illness (e.g., measles, chickenpox).

**Specific site:**  
**Eye, other than conjunctivitis**

*DEFINITION:* An infection of the eye, other than conjunctivitis, must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from anterior or posterior chamber of vitreous fluid.

- **Criterion 2:** Patient has at least two of the following signs or symptoms with no other recognised cause: eye pain, visual disturbance, or hypopyon and at least one of the following:
  - a. Physician’s diagnosis of an eye infection
  - b. Positive antigen test on blood (e.g., *H. influenzae, S. pneumoniae*)
  - c. Organisms cultured from blood
**Specific site: Ear and mastoid**

*DEFINITION:* Ear and mastoid infections must meet the following applicable criteria:

**Otitis externa** must meet at least one of the following criteria:

- **Criterion 1:** Patient has pathogens cultured from purulent drainage from ear canal.

- **Criterion 2:** Patient has at least *one* of the following signs or symptoms with no other recognised cause: fever (>38°C), pain, redness, or drainage from ear canal and organisms seen on Gram stain of purulent drainage.

**Otitis media** must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from fluid from middle ear obtained by tympanocentesis or at surgical operation.

- **Criterion 2:** Patient has at least *two* of the following signs or symptoms with no other recognised cause: fever (>38°C) pain in the eardrum, inflammation, retraction or decreased mobility of eardrum, or fluid behind eardrum.

**Otitis interna** must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from fluid from inner ear obtained at surgical operation.

- **Criterion 2:** Patient has a physician’s diagnosis of inner ear infection.

**Mastoiditis** must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from purulent drainage from mastoid.

- **Criterion 2:** Patient has at least *two* of the following signs or symptoms with no other recognised cause: fever (>38°C), pain, tenderness, erythema, headache, or facial paralysis and at least *one* of the following:
  - Organisms seen on Gram stain of purulent material from mastoid
  - Positive antigen test on blood
Specific site: Oral cavity (mouth, tongue, or gums)

DEFINITION: Oral cavity infections must meet at least one of the following criteria:

Criterion 1: Patient has organisms cultured from purulent material from tissues of oral cavity.

Criterion 2: Patient has an abscess or other evidence of oral cavity infection seen on direct examination, during a surgical operation, or during a histopathological examination.

Criterion 3: Patient has at least one of the following signs or symptoms with no other recognised cause: abscess, ulceration, or raised white patches on inflamed mucosa, or plaques on oral mucosa and at least one of the following:
   a. Organisms seen on Gram stain
   b. Positive potassium hydroxide (KOH) stain
   c. Multinucleated giant cells seen on microscopic examination of mucosal scrapings
   d. Positive antigen test on oral secretions
   e. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen
   f. Physician diagnosis of infection and treatment with topical or oral antifungal therapy

Specific site: Sinusitis

DEFINITION: Sinusitis must meet at least one of the following criteria:

Criterion 1: Patient has organisms cultured from purulent material obtained from sinus cavity.

Criterion 2: Patient has at least one of the following signs or symptoms with no other recognised cause: fever (>38°C), pain or tenderness over the involved sinus, headache, purulent exudate, or nasal obstruction and at least one of the following:
   a. Positive transillumination
   b. Positive radiographic examination

Specific site: Upper respiratory tract, pharyngitis, laryngitis, epiglottitis

DEFINITION: Upper respiratory tract infections must meet at least one the following criteria:

Criterion 1: Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), erythema of pharynx, sore throat, cough, hoarseness, of purulent exudate in throat and at least one of the following:
   a. Organisms cultured from the specific site
   b. Organisms cultured from blood
   c. Positive antigen test on blood or respiratory secretions
   d. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen
   e. Physician’s diagnosis of an upper respiratory infection

Criterion 2: Patient has an abscess seen on direct examination, during a surgical operation, or during a histopathological examination.
**Major Infection Site: Gastrointestinal System Infection**

**Specific site: Gastroenteritis**

**DEFINITION:** Gastroenteritis must meet at least one of the following criteria:

- **Criterion 1:** Patient has an acute onset of diarrhoea (liquid stools for more than 12 hours) with or without vomiting or fever (>38°C) and no likely non-infectious cause (e.g., diagnostic tests, therapeutic regimen, acute exacerbation of a chronic condition, or psychological stress).

- **Criterion 2:** Patient has at least two of the following signs or symptoms with no other recognised cause: nausea, vomiting, abdominal pain, or headache and at least one of the following:
  - a. An enteric pathogen is cultured from stool or rectal swab
  - b. An enteric pathogen is detected by routine or electron microscopy
  - c. An enteric pathogen is detected by antigen or antibody assay on blood or faeces
  - d. Evidence of an enteric pathogen is detected by cytopathic changes in tissue culture (toxin assay)
  - e. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen

**Specific site: GI tract**

*(oesophagus, stomach, small and large bowel, and rectum)*

**excluding gastroenteritis and appendicitis**

**DEFINITION:** Gastrointestinal tract infections, excluding gastroenteritis and appendicitis, must meet at least one of the following criteria:

- **Criterion 1:** Patient has an abscess or other evidence of infection seen during a surgical operation or histopathological examination.

- **Criterion 2:** Patient has at least two of the following signs or symptoms with no other recognised cause and compatible with infection of the organ or tissue involved: fever (>38°C), nausea, vomiting, abdominal pain, or tenderness and at least one of the following:
  - a. Organisms cultured from drainage or tissue obtained during a surgical operation or endoscopy or from a surgically placed drain
  - b. Organisms seen on Gram or KOH stain or multinucleated giant cells seen on microscopic examination of drainage or tissue obtained during a surgical operation or endoscopy or from a surgically placed drain
  - c. Organisms cultured from blood
  - d. Evidence of pathologic findings on radiological examination
  - e. Evidence of pathologic findings on endoscopic examination (e.g., *Candida oesophagitis* or proctitis)
**Specific site: Hepatitis**

**DEFINITION:** Hepatitis must meet the following criterion:

Patient has at least two of the following signs or symptoms with no other recognised cause:
- fever (>38°C), anorexia, nausea, vomiting, abdominal pain, jaundice, or history of transfusion within the previous 3 months
- at least one of the following:
  - Positive antigen or antibody test for hepatitis A, hepatitis B, hepatitis C, or delta hepatitis
  - Abnormal liver function tests (e.g., elevated alanine/aspartate aminotransferases, bilirubin)
  - Cytomegalovirus detected in urine or oropharyngeal secretions

**REPORTING INSTRUCTIONS:**
- Do not report hepatitis or jaundice of non-infectious origin (alpha-1 antitrypsin deficiency, etc.).
- Do not report hepatitis or jaundice that result from exposure to hepatotoxins (alcoholic or acetaminophen-induced hepatitis, etc.).
- Do not report hepatitis or jaundice that result from biliary obstruction (cholecystitis).

**Specific site: Intraabdominal including gallbladder, bile ducts, liver (excluding viral hepatitis), spleen, pancreas, peritoneum, subphrenic or subdiaphragmatic space, or other intraabdominal tissue or area not specified elsewhere**

**DEFINITION:** Intraabdominal infections must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from purulent material from intraabdominal space obtained during a surgical operation or needle aspiration.
- **Criterion 2:** Patient has abscess or other evidence of intraabdominal infection seen during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), nausea, vomiting, abdominal pain, or jaundice and at least one of the following:
  - Organisms cultured from drainage from surgically placed drain (e.g., closed suction drainage system, open drain, T-tube drain)
  - Organisms seen on Gram stain of drainage or tissue obtained during surgical operation or needle aspiration
  - Organisms cultured from blood and radiographic evidence of infection, for example, abnormal findings on ultrasound, CT, MRI, or radiolabel scans (gallium, technetium, etc.) or on abdominal x-ray

**REPORTING INSTRUCTION:**
- Do not report pancreatitis (an inflammatory syndrome characterised by abdominal pain, nausea, and vomiting associated with high serum levels of pancreatic enzymes) unless it is determined to be infectious in origin.
Major Infection Site: Reproductive Tract Infection

Specific site: Endometritis

**DEFINITION:** Endometritis must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from fluid or tissue from endometrium obtained during surgical operation, by needle aspiration, or by brush biopsy.
- **Criterion 2:** Patient has at least two of the following signs or symptoms with no other recognized cause: fever (>38°C), abdominal pain, uterine tenderness, or purulent drainage from uterus.

**REPORTING INSTRUCTION:**
- Report postpartum endometritis as a nosocomial infection unless the amniotic fluid is infected at the time of admission or the patient was admitted 48 hours after rupture of the membrane.

Specific site: Episiotomy

**DEFINITION:** Episiotomy infections must meet at least one of the following criteria:

- **Criterion 1:** Postvaginal delivery patient has purulent drainage from the episiotomy.
- **Criterion 2:** Postvaginal delivery patient has an episiotomy abscess.

**REPORTING INSTRUCTION:**
- Episiotomy is not a NHSN operative procedure; do not report as an SSI.

Specific site: Vaginal cuff

**DEFINITION:** Vaginal cuff infections must meet at least one of the following criteria:

- **Criterion 1:** Post hysterectomy patient has purulent drainage from the vaginal cuff.
- **Criterion 2:** Post hysterectomy patient has an abscess at the vaginal cuff.
- **Criterion 3:** Post hysterectomy patient has pathogens cultured from fluid or tissue obtained from the vaginal cuff.

**REPORTING INSTRUCTION:**
- Most vaginal cuff infections are SSI Organ/Space.
- Report only late onset (>30 days after hysterectomy) Reproductive Tract Infection.

Specific site: Other infections of the male or female reproductive tract

**(epididymis, testes, prostate, vagina, ovaries, uterus, or other deep pelvic tissues, excluding endometritis or vaginal cuff infections)**

**DEFINITION:** Other infections of the reproductive tract must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from tissue or fluid from affected site.
- **Criterion 2:** Patient has an abscess or other evidence of infection of affected site seen during a surgical operation or histopathological examination.
- **Criterion 3:** Patient has two of the following signs or symptoms with no other recognized cause: fever (>38°C), nausea, vomiting, pain, tenderness, or dysuria and at least one of the following:
  - Organisms cultured from blood
  - Diagnosis by physician
**Major Infection Site:**  Skin and Soft Tissue Infection

**Specific site:**  Skin

*DEFINITION:* Skin infections must meet at least one of the following criteria:

- **Criterion 1:** Patient has purulent drainage, pustules, vesicles, or boils.
- **Criterion 2:** Patient has at least **two** of the following signs or symptoms with no other recognised cause: pain or tenderness, localised swelling, redness, or heat
  and at least **one** of the following:
  - a. Organisms cultured from aspirate or drainage from affected site; if organisms are normal skin flora (e.g., coagulase negative staphylococci, micrococci, diphtheroids) they must be a pure culture
  - b. Organisms cultured from blood
  - c. Positive antigen test performed on infected tissue or blood (e.g., herpes simplex, varicella zoster, *H. influenzae, N. meningitidis*)
  - d. Multinucleated giant cells seen on microscopic examination of affected tissue
  - e. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen

*COMMENT:* Nosocomial skin infections may be the result of exposure to a variety of procedures performed in the hospital.
- Superficial incisional infections after surgery are identified separately as SSI.
- Other skin infections associated with important exposures are identified with their own sites and are listed in the section on reporting instructions.

**Specific site:**  Soft tissue

*DEFINITION:* Soft tissue infections must meet at least one of the following criteria:

- **Criterion 1:** Patient has organisms cultured from tissue or drainage from affected site.
- **Criterion 2:** Patient has purulent drainage at affected site.
- **Criterion 3:** Patient has an abscess or other evidence of infection seen during a surgical operation or histopathological examination.
- **Criterion 4:** Patient has at least **two** of the following signs of symptoms at the affected site with no other recognised cause: localised pain or tenderness, redness, swelling, or heat
  and at least **one** of the following:
  - a. Organisms cultured from blood
  - b. Positive antigen test performed on blood or urine (e.g., *H. influenzae, S. pneumoniae, N. meningitidis*, group B *Streptococcus, Candida sp.*)
  - c. Diagnostic single antibody titre (IgM) or fourfold increase in paired sera (IgG) for pathogen
**Specific site: Decubitus ulcer, including both superficial and deep infections**

**DEFINITION:** Decubitus ulcer infections must meet the following criterion:

- Patient has at least *two* of the following signs or symptoms with no other recognised cause: redness, tenderness, or swelling of decubitus wound edges
- and
- at least *one* of the following:
  - Organisms cultured from properly collected fluid or tissue (see comments)
  - Organisms cultured from blood

**COMMENTS:**
- Purulent drainage alone is not sufficient evidence of an infection.
- Organisms cultured from the surface of a decubitus ulcer are not sufficient evidence that the ulcer is infected. A properly collected specimen from a decubitus ulcer involves needle aspiration of fluid or biopsy of tissue from the ulcer margin.

**Specific site: Burn**

**DEFINITION:** Burn infections must meet one of the following criteria:

- **Criterion 1:** Patient has a change in burn wound appearance or character, such as rapid eschar separation; dark brown, black, or violaceous discoloration of the char; or oedema at wound margin
  - and
  - histological examination of burn biopsy shows invasion of organisms into adjacent viable tissue.

- **Criterion 2:** Patient has a change in burn wound appearance or character, such as rapid eschar separation; dark brown, black, or violaceous discoloration of the eschar; or oedema at wound margin
  - and
  - at least *one* of the following:
    - Organisms cultured from blood in the absence of other identifiable infection
    - Isolation of herpes simplex virus, histological identification of inclusions by light or electron microscopy or visualisation of viral particles by electron microscopy in biopsies or lesion scrapings

- **Criterion 3:** Patient with a burn has at least *two* of the following signs or symptoms with no other recognised cause: fever (>38°C) or hypothermia (<36°C), hypotension, oliguria (<20 cm³/hr), hyperglycaemia at previously tolerated level of dietary carbohydrate, or mental confusion
  - and
  - at least *one* of the following:
    - Histological examination of burn biopsy shows invasion of organisms into adjacent viable tissue
    - Organisms cultured from blood
    - Isolation of herpes simplex virus, histological identification of inclusions by light or electron microscopy, or visualisation of viral particles electron microscopy in biopsies or lesion scrapings

**Specific site: Breast abscess or mastitis**

**DEFINITION:** A breast abscess or mastitis must meet at least one of the following criteria:

- **Criterion 1:** Patient has a positive culture of affected breast tissue or fluid obtained by incision and drainage or needle aspiration.

- **Criterion 2:** Patient has a breast abscess or other evidence of infection seen during a surgical operation or histopathological examination.

- **Criterion 3:** Patient has fever (>38°C) and local inflammation of the breast and physician’s diagnosis of breast abscess.

**COMMENT:**
- Breast abscesses occur most frequently after childbirth. Those that occur within 7 days after childbirth should be considered nosocomial.
**Major Infection Site:** SYSTEMIC (DISSEMINATED) INFECTION

**DEFINITION:** Systemic (disseminated) infection is infection involving multiple organs or systems, without an apparent single site of infection, usually of viral origin, and with signs or symptoms with no other recognised cause and compatible with infectious involvement of multiple organs or systems.

**REPORTING INSTRUCTIONS:**
- This code should be used primarily for viral infections involving multiple organ systems (e.g., measles, mumps, rubella, varicella, erythema infectiosum). These infections often can be identified by clinical criteria alone. Do not use this code for nosocomial infections with multiple metastatic sites, such as with bacterial endocarditis; only the primary site of these infections should be reported.
- **Do not report fever of unknown origin as Systemic (disseminated) infection.**
Major Infection Site: Lower Respiratory Tract Infection (other than pneumonia)

Specific site: Bronchitis, tracheobronchitis, bronchiolitis, tracheitis, without evidence of pneumonia

DEFINITION: Tracheobronchial infections must meet at least one of the following criteria:

- Patient has no clinical or radiographic evidence of pneumonia
- Patient has at least two of the following signs or symptoms with no other recognised cause: fever (>38°C), cough, new or increased sputum production, rhonchi, wheezing
- At least one of the following:
  a. Positive culture obtained by deep tracheal aspirate or bronchoscopy
  b. Positive antigen test on respiratory secretions

REPORTING INSTRUCTION:
- Do not report chronic bronchitis in a patient with chronic lung disease as an infection unless there is evidence of an acute secondary infection, manifested by change in organism.

Specific site: Other infections of the lower respiratory tract

DEFINITION: Other infections of the lower respiratory tract must meet at least one of the following criteria:

- Criterion 1: Patient has organisms seen on smear or cultured from lung tissue or fluid, including pleural fluid.
- Criterion 2: Patient has a lung abscess or empyema seen during a surgical operation or histopathological examination.
- Criterion 3: Patient has an abscess cavity seen on radiographic examination of lung.

REPORTING INSTRUCTIONS:
- Report concurrent lower respiratory tract infection and pneumonia as Pneumonia.
APPENDIX 3A CRITERIA FOR DEFINING NOSOCOMIAL PNEUMONIA

General comments applicable to all pneumonia specific site criteria

a. Physician’s diagnosis of pneumonia alone is **not an acceptable criterion** for nosocomial pneumonia.

b. When assessing a patient for presence of pneumonia, it is important to distinguish between changes in clinical status resulting from other conditions such as myocardial infarction, pulmonary embolism, respiratory distress syndrome, atelectasis, malignancy, chronic obstructive pulmonary disease, hyaline membrane disease, bronchopulmonary dysplasia, and so forth. Also, care must be taken when assessing intubated patients to distinguish between tracheal colonisation, upper respiratory tract infections (e.g., tracheobronchitis), and early onset pneumonia. Finally, it should be recognised that it may be difficult to determine nosocomial pneumonia in the elderly, infants, and immunocompromised patients because such conditions may mask typical signs or symptoms associated with pneumonia. Alternate specific criteria for the elderly, infants and immunocompromised patients have been included in this definition of nosocomial pneumonia.

c. Pneumonia resulting from gross aspiration (e.g., in the setting of intubation in the emergency room or operating room) is considered nosocomial if it meets any specific criteria and was not clearly present or incubating at the time of admission to the hospital.

d. Positive Gram stain for bacteria and positive KOH mount for elastin fibres and/or fungal hyphae from appropriately collected sputum specimens are important clues that point toward the aetiology of the infection. However, sputum samples are frequently contaminated with airway colonisers and, therefore, must be interpreted cautiously. In particular, *Candida* is commonly seen on stain but infrequently causes nosocomial pneumonia.

**Abbreviations**

- BAL—bronchoalveolar lavage
- EIA—enzyme immunoassay
- FAMA—fluorescent-antibody staining of membrane antigen
- IFA—immunofluorescent antibody
- LRT—lower respiratory tract
- PCR—polymerase chain reaction
- PMN—polymorphonuclear leukocyte
- RIA—radioimmunoassay

**Reporting Instructions**

There is a hierarchy of specific site categories within the major site pneumonia. Even if a patient meets criteria for more than one specific site, report only one:

- If a patient meets criteria for both PNEU1 and PNEU2, report PNEU2.
- If a patient meets criteria for both PNEU2 and PNEU3, report PNEU3.
- If a patient meets criteria for both PNEU1 and PNEU3, report PNEU3.

- Report concurrent lower respiratory tract infection (e.g., abscess or empyema) and pneumonia with the same organism(s) as pneumonia.
- Report acute bronchitis, tracheitis, tracheobronchitis, or bronchiolitis without pneumonia as Lower Respiratory Tract Infection (other than pneumonia).
FIGURE 4. PNEUMONIA FLOW DIAGRAM

**X-Ray**
- Patient without underlying disease: 2 or more criteria
- New or progressive and persistent infiltrate
- Consolidation
- Cavititation

**At least one of the following:**
- Fever (>38°C/100.4°F) with no other cause
- Leukopenia (<4,000 WBC/mm³) or leukocytosis (>12,000 WBC/mm³)
- Altered mental status with no other cause, in ≥70 y.o.

**X-Ray**
- Patient with underlying disease: 1 or more criteria
- New or progressive and persistent infiltrate
- Consolidation
- Cavititation

**At least one of the following:**
- Fever (>38°C/100.4°F) with no other cause
- Altered mental status with no other cause, in ≥70 y.o.
- New onset of purulent sputum or change in character of sputum, or upper respiratory secretions or coughing requirements
- New onset of worsening cough, or dyspnea, or tachypnea
- Rales or bronchial breath sounds
- New onset of cough or change in character of sputum, or upper respiratory secretions or coughing requirements
- New onset of worsening cough, or dyspnea, or tachypnea
- Rales or bronchial breath sounds
- Worsening gas exchange (e.g., desaturation, PaO₂/FiO₂ ≤ 240, PaO₂ < 80, or need for ventilation demand)

**Signs and Symptoms**
- Positive blood culture not related to another infection
- Positive pleural fluid culture
- Positive quantitative cultures from minimally contaminated LRT specimen (e.g., BAL, protected specimen brush)
- ≥ 5% BAL mononuclear cells contain intracellular bacteria on direct microscopic examination
- Histopathological examination shows one of the following:
  - Abscess formation or lack of consolidation with intense PMN accumulation in bronchioli and alveoli
  - Positive quantitative cultures of lung parenchyma
  - Evidence of lung parenchyma invasion by fungal hyphae or pseudohyphae

**Laboratory**
- Positive culture of fungus or Candida from respiratory secretions
- Positive detection of viral antigen or antibody from respiratory secretions (e.g., EIA, FAMA, shell vial assay, PCR)
- 4-fold rise in paired sera (i.e., for pathogens e.g., influenza virus, Chlamydia)
- Positive KTB for Chlamydia or Mycoplasma
- Positive micro-IF test for Chlamydia
- Positive culture of micro-IF of Legionella spp. from respiratory secretions or tissue
- Detection of Legionella pneumoniae serogroup 1 antigens in urine by RIA or EIA
- 4-fold rise in L. pneumophila antibody titre ≥ 1:128 in paired acute and convalescent sera by indirect IFA

**Pathology**
- PMU1: Clinically defined pneumonia
- PMU2: Pneumonia with common bacterial or filamentous fungal pathogens and specific lab findings
- PMU3: Pneumonia with viral, Legionella, Chlamydia, Mycoplasma, and other uncommon pathogens and specific lab findings

**Immunocompromised**
- Haemorrhage
- Pleuritic chest pain
APPENDIX 3B PNEUMONIA ALGORITHMS

Table 6. Algorithms for Clinically Defined Pneumonia (PNEU1)

LABORATORY CRITERIA DEFINED UNDER PNU2 | At least one of the following:  
  - Matching positive blood and sputum cultures with *Candida* spp.\(^14,15\)  
  - Evidence of fungi or *Pneumocystis carinii* from minimally contaminated LRT specimen (e.g., BAL or protected specimen brushing) from one of the following:  
    - Direct microscopic exam  
    - Positive culture of fungi  
  
Any of the following from:  
LABORATORY CRITERIA DEFINED UNDER PNU2 |
1. Occasionally, in nonventilated patients, the diagnosis of nosocomial pneumonia may be quite clear on the basis of symptoms, signs, and a single definitive chest radiograph. However, in patients with pulmonary or cardiac disease (e.g., interstitial lung disease or congestive heart failure), the diagnosis of pneumonia may be particularly difficult. Other non-infectious conditions (e.g., pulmonary oedema from decompensated congestive heart failure) may simulate the presentation of pneumonia. In these more difficult cases, serial chest radiographs must be examined to help separate infectious from non-infectious pulmonary processes. To help confirm difficult cases, it may be useful to review radiographs on the day of diagnosis, 3 days prior to the diagnosis and on days 2 and 7 after the diagnosis. Pneumonia may have rapid onset and progression but does not resolve quickly. Radiographic changes of pneumonia persist for several weeks. As a result, rapid radiograph resolution suggests that the patient does not have pneumonia but rather a non-infectious process such as atelectasis or congestive heart failure.

2. Note that there are many ways of describing the radiographic appearance of pneumonia. Examples include, but are not limited to, air-space disease, focal opacification, and patchy areas of increased density. Although perhaps not specifically delineated as pneumonia by the radiologist, in the appropriate clinical setting these alternative descriptive wordings should be seriously considered as potentially positive findings.

3. Purulent sputum is defined as secretions from the lungs, bronchi, or trachea that contain ≥25 neutrophils and ≤10 squamous epithelial cells per low power field (X100). If your laboratory reports these data qualitatively (e.g., many WBCs or few squames), be sure their descriptors match this definition of purulent sputum. This laboratory confirmation is required because written clinical descriptions of purulence are highly variable.

4. A single notation of either purulent sputum or change in character of the sputum is not meaningful; repeated notations over a 24-hour period would be more indicative of the onset of an infectious process. Change in character of sputum refers to the colour, consistency, odour, and quantity.

5. In adults, tachypnoea is defined as respiration rate >25 breaths per minute.

6. Rales may be described as crackles.

7. This measure of arterial oxygenation is defined as the ratio of the arterial tension (PaO2) to the inspiratory fraction of oxygen (FiO2).

8. Care must be taken to determine the aetiology of pneumonia in a patient with positive blood cultures and radiographic evidence of pneumonia, especially if the patient has invasive devices in place such as intravascular lines or an indwelling urinary catheter. In general, in an immunocompetent patient, blood cultures positive for coagulase negative staphylococci, common skin contaminants, and yeasts will not be the etiologic agent of the pneumonia.

9. Refer to Table A-2.1 for threshold values of bacteria from cultured specimens. An endotracheal aspirate is not a minimally contaminated specimen. Therefore, an endotracheal aspirate does not meet the laboratory criteria.

10. Once laboratory-confirmed cases of pneumonia due to respiratory syncytial virus (RSV), adenovirus, or influenza virus have been identified in a hospital, clinician’s presumptive diagnosis of these pathogens in subsequent cases with similar clinical signs and symptoms is an acceptable criterion for presence of nosocomial infection.

11. Scant or watery sputum is commonly seen in adults with pneumonia due to viruses and *Mycoplasma* although sometimes the sputum may be mucopurulent.

12. Few bacteria may be seen on stains of respiratory secretions from patients with pneumonia due to *Legionella* spp, *Mycoplasma*, or viruses.

13. Immunocompromised patients include those with neutropaenia (absolute neutrophil count <500/mm³), leukaemia, lymphoma, HIV with CD4 count <200, or splenectomy; those who are in their transplant hospital stay; and those who are on cytotoxic chemotherapy, high dose steroids, or other immunosuppressives daily for >2 weeks [e.g., >40mg of prednisone or its equivalent (>160mg hydrocortisone, >32mg methylprednisolone, >6mg dexamethasone, >200mg cortisone)].

14. Blood and sputum specimens must be collected within 48 hours of each other.

15. Semi quantitative or nonquantitative cultures of sputum obtained by deep cough, induction, aspiration, or lavage are acceptable. If quantitative culture results are available, refer to algorithms that include such specific laboratory findings.
