

# National SARS-CoV-2 Wastewater Surveillance Programme Week 10 2022 (06/03/2022—12/03/2022)

Report prepared on 23/03/2022

# **Background**

People with COVID-19/SARS-CoV-2 infection can shed the virus in their stool, which can then be detected in wastewater, making environmental surveillance of wastewater a feasible means to monitor the circulation of SARS-CoV-2, the virus that causes COVID-19 disease, in the population.

The National SARS-CoV-2 Wastewater Surveillance Programme (NWSP) has been established through a partnership with Irish Water, the National Virus Reference Laboratory (NVRL), University College Dublin (UCD), the HSE Health Protection Surveillance Centre (HPSC) and Health Intelligence Unit (HIU). Samples from 68 wastewater catchment areas across Ireland are taken on a weekly basis and analysed for the presence of SARS-CoV-2. The wastewater catchment area of Ringsend in Dublin is sampled twice a week given the size of the population it captures. These 68 wastewater catchment areas (see Figure 2) cover 80% of the population connected to public wastewater treatment facilities.

The NWSP is an additional tool in Ireland's response to COVID-19/ SARS-CoV-2. The NWSP aims to complement our case-based surveillance systems (i.e. monitoring the number of people testing positive or presenting to a healthcare provider with symptoms) through acting as an early warning system for the circulation, or an increase in the circulation, of SARS-CoV-2 in a wastewater catchment area.

Please note that stool or wastewater are not recognised sources of transmission for SARS-CoV-2. Standard hygiene measures should be used after using the toilet. <u>Guidance from the WHO</u> for water and sanitation providers recommends standard best practices, including PPE for those working in proximity to wastewater, be followed.

# Summary of results from week 10, 2022

In week 10<sup>1</sup>, 2022 SARS-CoV-2 was detected in wastewater samples from the 65 wastewater catchment areas analysed (n=66). These results are in keeping with the high incidence rate of COVID-19 currently being seen throughout Ireland.

Please read 'Data uses' and 'Data limitations and uncertainties' in the technical notes prior to making any interpretation of the data.

<sup>&</sup>lt;sup>1</sup> Dates of epidemiological weeks are available in the technical notes and at: https://www.hpsc.ie/notifiablediseases/resources/epidemiologicalweeks/

## Overview of SARS-CoV-2 detection in wastewater in Ireland

Results are presented as the numerical value of the concentration of SARS-CoV-2 in the wastewater sample and as a descriptive category. The descriptive categories used are 'positive' when SARS-CoV-2 RNA was detected and could be quantified; 'weak positive' when SARS-CoV-2 RNA was detected but was below the quantification limit (BQL); 'undetected' when the numerical value was below the detection limit (BDL); and 'unavailable' if a result was not available because either a sample was not received or could not be fully analysed e.g. if flow data were not available. Please see the glossary and technical notes for further explanations.

In week 10, 2022, 67 samples were received and analysed for 66 wastewater catchment areas (Ringsend catchment area served by Ringsend wastewater treatment plant is sampled twice a week). SARS-CoV-2 RNA was detected in samples from 65 wastewater catchment areas. Of the 65 catchment areas for which a change from the previous week could be calculated, the viral load remained stable (within +/- 10%) in 39 of them, while 4 experienced decreases of 10% or more, and 22 saw increases of at least 10%. Of these, 18 had an increase from 10 to 50%, and 4 had an increase of more than 50% (See Figure 2) . Waste water sampling was limited over the Christmas/New Year period (Week 51, 2021 – Week 1, 2022). Data from Youghal catchment area prior week 1, 2022 and from Fermoy catchment area after week 52 2021 are not included due to potential sampling errors.

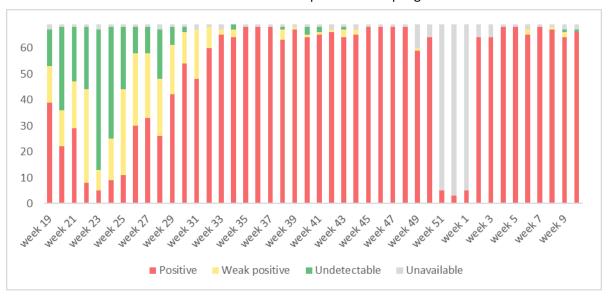

Figure 1. SARS-CoV-2 detection categories in Ireland by week, NWSP, weeks 19, 2021—10, 2022
\*Samples with an undetected result may have SARS-CoV-2 present but the amount was too low to be detected by the test. It does not mean that SARS-CoV-2 is not circulating in the wastewater catchment area of the Wastewater treatment plant (WWTP).

Table 1 and Figure 2 summarise the results from wastewater samples taken during week 10, 2022. Figures 1 and Table 2a summarises the results by category for each wastewater catchment area during weeks 19, 2021—10, 2022 for all NWSP catchment areas except Ringsend. Results for the Ringsend catchment area is summarised separately in Table 2b and Figure 3b as samples are taken at Ringsend biweekly.

Figure 3 summarises the SARS-CoV-2 RNA levels and 3 week moving average of those levels by wastewater catchment area each week since the start of the NWSP in week 19, 2021.

Please note that wastewater data from different wastewater catchment areas should not be directly compared. All data are subject to ongoing validation.

Table 1. National Wastewater Surveillance Programme sampling results by wastewater catchment area, week 10, 2022

Middow	Greystones	Complete (composite)	08/03/2022	Positive
Wicklow	Wicklow	Complete (composite)	08/03/2022	Positive

<sup>\*</sup> Flow rate was not available at time of reporting, the average 2020 flow rate for the wastewater plant is used to calculate result.

<sup>\*\*</sup> Samples with an 'undetectable' result may have SARS-CoV-2 present but the amount was too low to be detected by the test. It does not mean that SARS-CoV-2 is not circulating in the wastewater catchment area.

Table 2a. SARS-CoV-2 detections in wastewater samples by wastewater catchment area and week, NWSP, week 19 to week 10, 2022

Positive Weak positive Undetectable\* Unavailable Dots indicate the result was obtained using average flow data

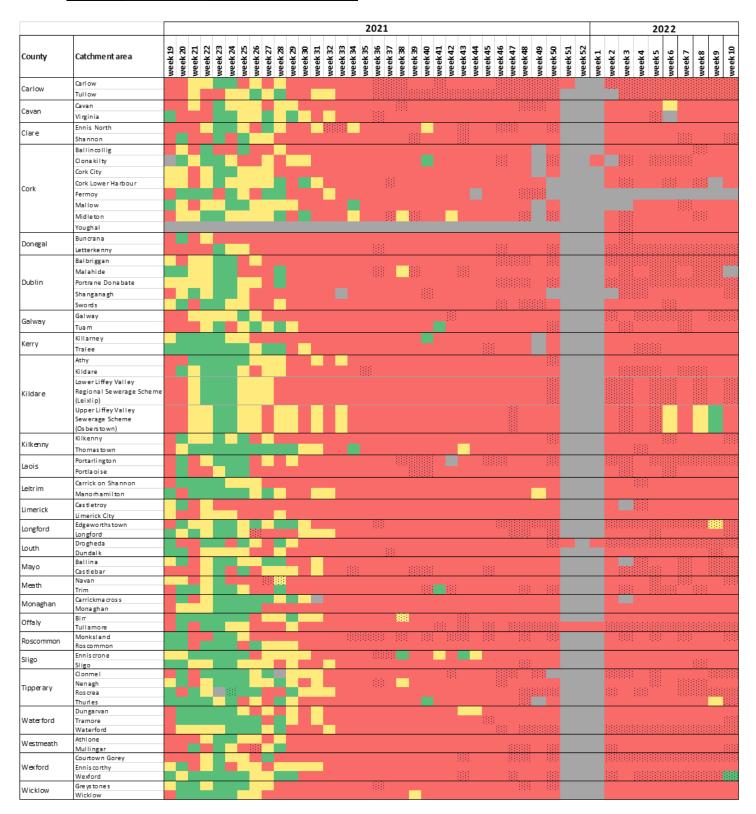

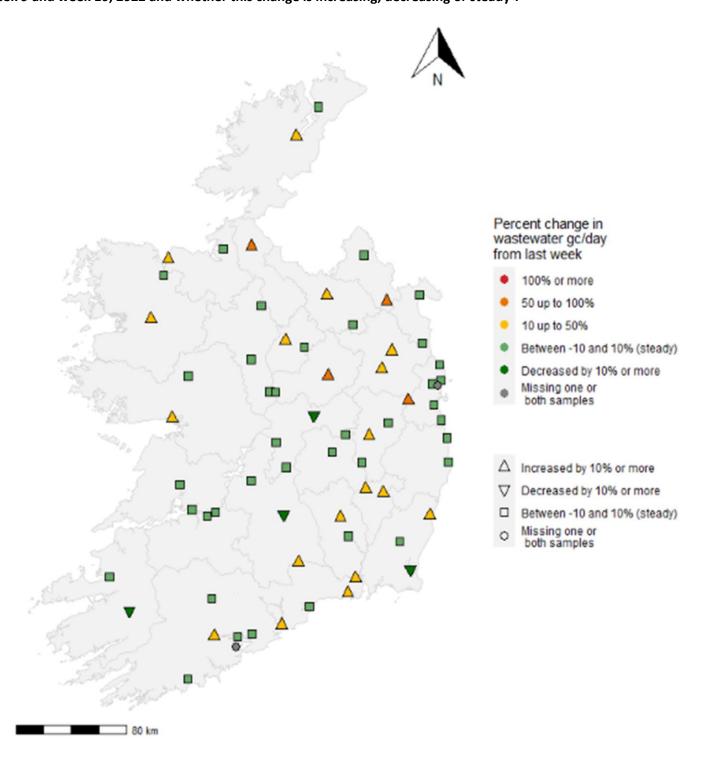

Table 2b. Biweekly results for SARS-CoV-2 detections in the Ringsend WWTP, week 19 to week 10, 2022

<sup>\*</sup> Flow rate was not available at time of reporting, the average 2020 flow rate for the wastewater plant is used to calculate result.

<sup>\*\*</sup>Samples with an 'undetectable' result may have SARS-CoV-2 present but the amount was too low to be detected by the test. It does not mean that SARS-CoV-2 is not circulating in the wastewater catchment area.

Figure 2. Map showing the approximate location of wastewater catchment areas and results for SARS-CoV-2 detections during week 10, 2022. Results are shown as percentage change in SARS-CoV-2 RNA (gc/day)<sup>\$</sup> between week 9 and week 10, 2022 and whether this change is increasing, decreasing or steady<sup>^</sup>.

Note: Viral load values based on GAM-smoothed estimates. See Techincal notes.

<sup>^</sup>Wastewater catchment areas where the percentage difference in gc/day has increased or decreased by less than 10% between the current and previous weeks are considered to be steady.

<sup>\$</sup>Viral load values based on GAM-smoothed estimates. See technical notes.

Figure 3a. SARS-CoV-2 concentration by wastewater catchment area by week (grey connected line), and 3 week moving average (maroon line), NWSP, weeks 19, 2021—10, 2022

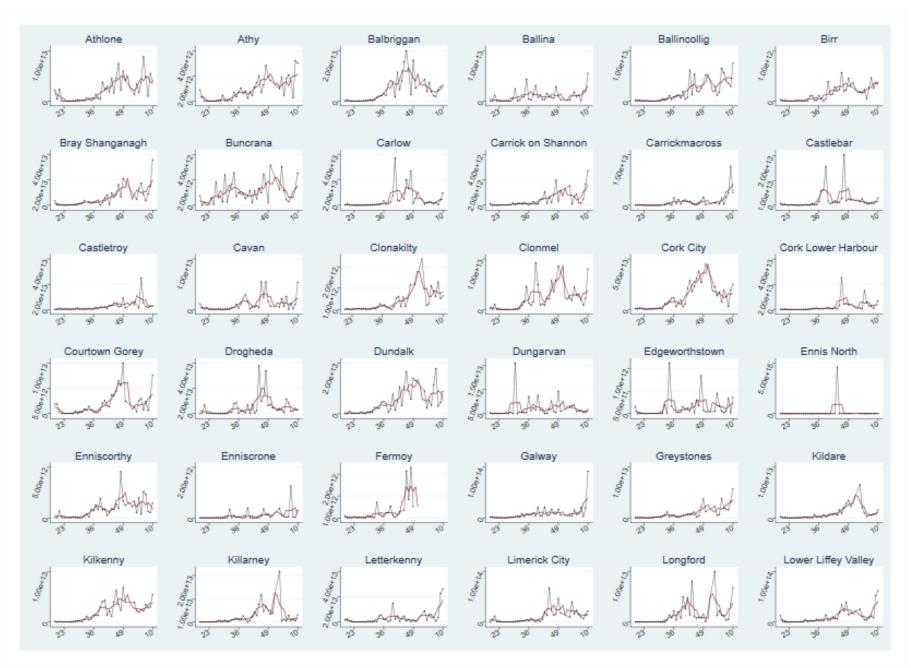

Figure 3a (continued). SARS-CoV-2 concentration by wastewater catchment area by sampling week (grey connected line), and 3 week moving average (maroon line), NWSP, weeks 19, 2021—10, 2022

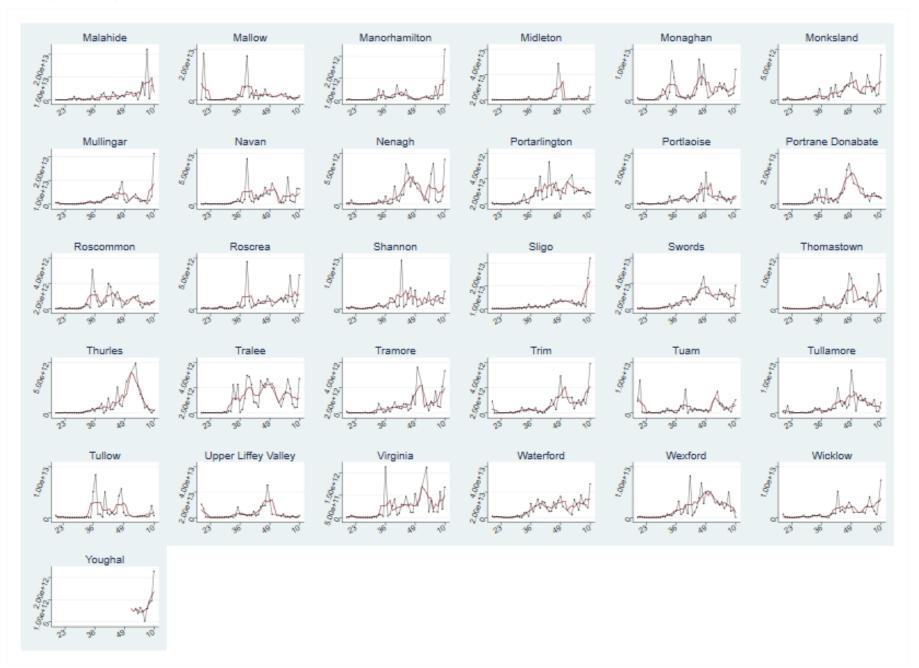

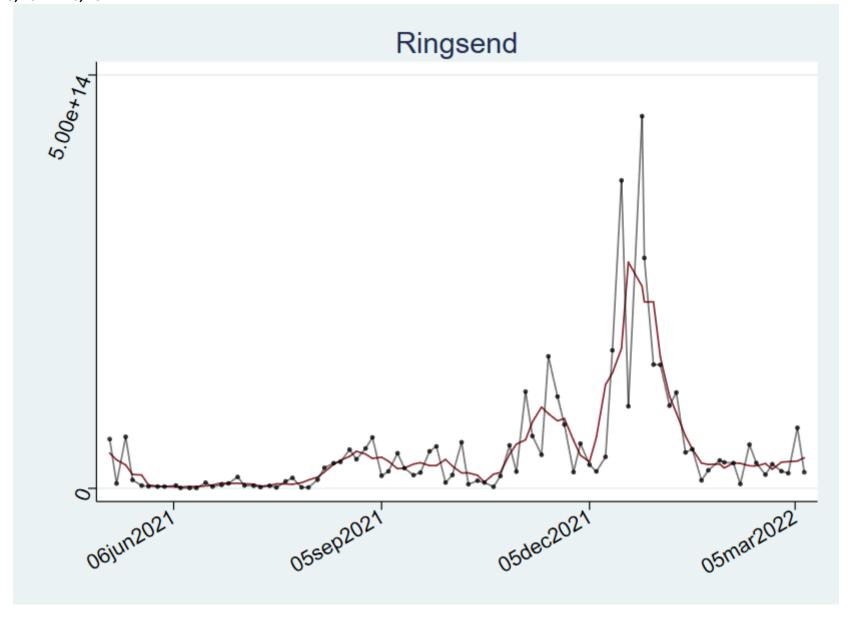

Figure 3b. SARS-CoV-2 concentration for Ringsend wastewater catchment area by sampling date (grey connected line), and 3 week moving average (maroon line), NWSP, weeks 19, 2021—10, 2022

# **Acknowledgements**

Sincere thanks are extended to all those who are participating in the collection and processing of samples, processing data and reporting of data used in this report. This includes the staff at participating wastewater treatment plants, Irish Water, laboratory staff (UCD and NVRL), HSE COVID-19 Contact Management Programme (CMP), Health Intelligence Unit (HIU), surveillance scientists, microbiologists and administrative staff.

Report prepared by COVID-19 Epidemiology Team, HPSC

# **Glossary**

#### Below detection limit (BDL):

The limit of detection is the lowest concentration of viral material that can be detected in a wastewater sample. If the concentration of viral material in a sample is below the limit of detection, it does not mean that there is no virus present. Viral material may be present, but it cannot be detected by the test due to its very low concentration.

#### **Below Quantifiable Limits (BQL)**

The limit of quantification is the lowest concentration of viral genetic material that can be reliably quantified. A result which is BQL means that viral RNA was detected but the concentration cannot be accurately determined.

#### **Composite Samples:**

Wastewater sample consists of numerous individual discrete samples taken at regular intervals over a period of 24 hours.

#### Flow rate

Is the total volume arising from the wastewater catchment area in the 24hours the sample is taken (m3 per day) as measured at the inlet of the wastewater treatment plant.

#### **Grab sample**

A wastewater sample collected at a particular time and place can represent only the composition of the source at that time and place.

## **Technical notes**

**Wastewater sample collection**: Staff of the participating wastewater treatment plants collect 24-hour composite samples on specified days. In some instances, incomplete composite, or grab samples may be collected.

Laboratory analysis of wastewater samples: Carried out by UCD. Following arrival of the wastewater samples in the laboratory, the virus is concentrated and the genetic material is extracted. The genetic material (RNA) is quantified using reverse transcriptase quantitative PCR which is used to determine the concentration of the virus in wastewater. The amount of viral genetic material per day entering a wastewater treatment plant can be calculated based on the concentration of the virus and the flow rate.

Selection of wastewater catchment areas for inclusion in the NWSP: Catchment areas were selected to provide the greatest coverage of the population and to represent catchment areas in all counties. Two catchment areas from each county have been included in the NWSP. In addition, we included all wastewater catchment areas greater than 10,000 population equivalent (PE) in size. The 68 wastewater catchment areas included in the NWSP cover 80% of the population connected to public wastewater treatment plants, and are shown in Figure 1.

**Case based data:** Data are currently based on information uploaded to the COVID Care Tracker (CCT). Please note that these data do not represent notified cases, and have not undergone normal data validation procedures. Data are therefore provisional and subject to ongoing review and update. As a result, figures in this report may differ from previously published figures.

Mapping: provided by Health intelligence Unit (HIU).

## Data uses

Since the onset of the Covid-19 pandemic, analysis of wastewater for the presence of SARS-CoV-2 has been taking place in many European countries and elsewhere as recommended by the European Union. The NWSP will work with Departments of Public Health and other stakeholders on how the data can best support the public health response to SARS-CoV-2/COVID-19 in Ireland. At the current stage of the pandemic, circulation is widespread with high incidence rates across Ireland. The NWSP will likely be of greatest value when the circulation of SARS-CoV-2 and testing rates are lower, when a detection of SARS-CoV-2 in wastewater may be the first indication of circulation in a catchment area.

The NWSP will also be of value in monitoring for the presence of new variants of SARS-CoV-2 as they emerge.

## **Data limitations and uncertainties**

In general, higher levels of SARS-CoV-2 in wastewater suggests more people with SARS-CoV-2 infection in the wastewater catchment area. However, people shed different amounts of virus during the period that they are infected which declines are as they are clearing the virus. For this and other reasons it is therefore difficult to reliably estimate the number of people with SARS-CoV-2 infection in the catchment area based on analysis of SARS-CoV-2 RNA in wastewater.

Aside from the number of people with SARS-CoV-2 infection, and the amount of virus they shed, there are other factors which influence the amount of SARS-CoV-2 detected in wastewater. For example, wastewater treatment plants also take in surface waters from rainfall, which alters the flow rate of influent entering the treatment plant. The concentration of SARS-CoV-2 is therefore adjusted to take the daily flow rate of the plant into account. When a flow rate is not available for the day the composite sample was taken, the average annual flow rate is used instead.

Composite samples are the preferred sample type as the reflect wastewater passing through the sampling point for a

24-hour period. However, composite samples are not always possible. The NWSP will continue to monitor its methodology as part of its quality improvement process.

NWSP data should be reviewed in conjunction with data from other case-based surveillance systems.

## **Further information**

Links to dashboards of other SARS-CoV-2 wastewater surveillance programmes are available here.
