

Influenza Summer Surveillance Report

A REPORT BY THE HEALTH PROTECTION SURVEILLANCE CENTRE IN COLLABORATION WITH THE IRISH COLLEGE OF GENERAL PRACTITIONERS, THE NATIONAL VIRUS REFERENCE LABORATORY & THE DEPARTMENTS OF PUBLIC HEALTH.

Weeks 21-25 2007 (21st May to 24th June 2007)

Summary

During weeks 21-25 2007, influenza activity remained at low levels in Ireland, with sentinel GP influenza-like illness (ILI) consultation rates peaking at 1.9 per 100,000 population. No specimens tested by the National Virus Reference Laboratory (NVRL) were positive for influenza during this period.

Background

The Health Protection Surveillance Centre (HPSC) is working in collaboration with the Irish College of General Practitioners (ICGP), the National Virus Reference Laboratory (NVRL) and the Departments of Public Health on this sentinel surveillance project. Forty-eight sentinel general practices have been recruited to report on the number of patients with ILI

on a weekly basis. Further information on the influenza sentinel surveillance system can be found on the HPSC website www.hpsc.ie.

Results

Clinical Data

During weeks 21-25 2007, six ILI cases were reported by sentinel GPs, with ILI consultation rates peaking at 1.9 per 100,000 during week 24 2007 (figure 1). The highest age specific ILI consultation rates during weeks 21-25 2007, were in those aged 0-4 years in week 24 2007, peaking at 8.9 per 100,000 population (figure 2). Approximately, 85% of sentinel GPs have reported on a timely basis each week during weeks 21-25 2007.

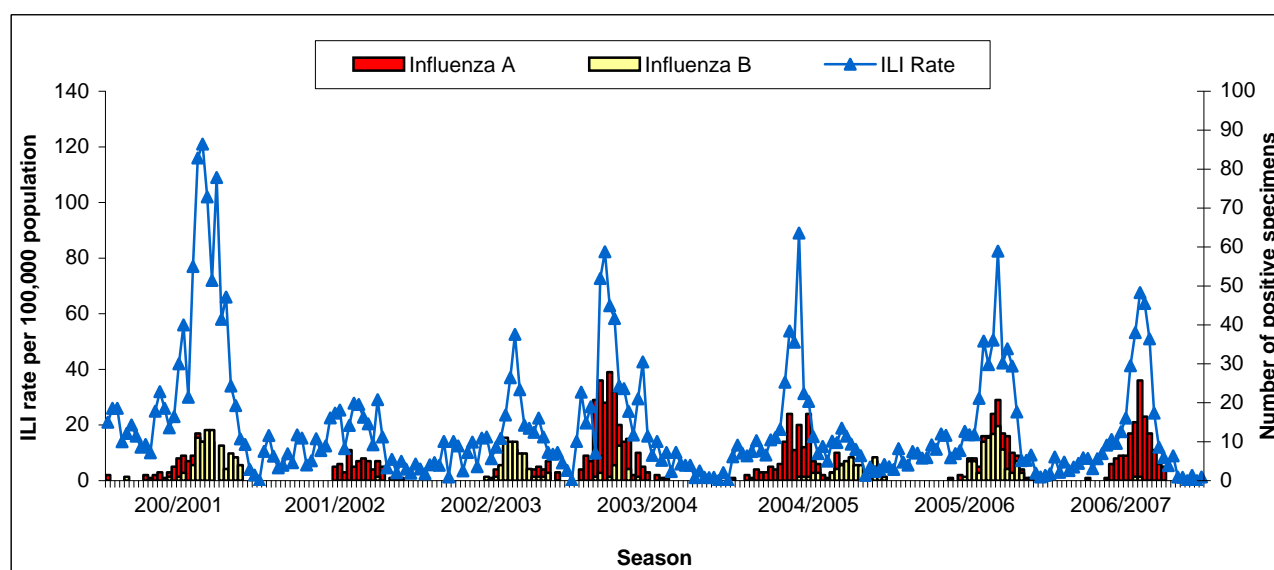

Figure 1: ILI rate per 100,000 population and the number of positive influenza specimens detected by the NVRL from 2000/2001 to the summer of 2007.

Results (continued)

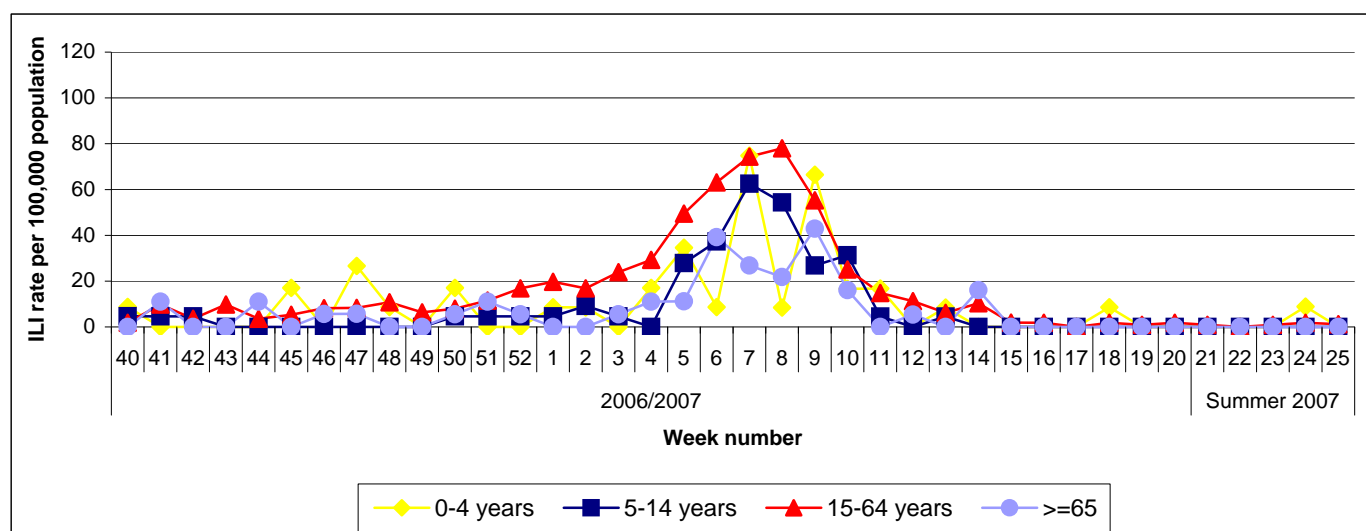

Figure 2: Age specific GP consultation rate* for ILI per 100,000 population by week during the 2006/2007 and summer 2007 influenza season.

*Please note the denominator used in the age specific consultation rate is from the 2006 census data; this assumes that the age distribution of the sentinel general practices is similar to the national age distribution.

NVRL Virological Data

The NVRL have tested three sentinel and 123 non-sentinel specimens during weeks 21-25 2007, no sentinel or non-sentinel specimens tested positive for influenza but two non-sentinel specimens were positive for respiratory syncytial virus (RSV) (table 1).

Table 1: Total number of sentinel and non-sentinel* respiratory specimens and positive results for weeks 21-25 2007.

Week Number	Specimen Type	Total Specimens	No. Influenza Positive	% Influenza Positive	Influenza A	Influenza B	RSV
21 – 25 2007	Sentinel	3	0	0.0	0	0	NA
	Non-Sentinel	123	0	0.0	0	0	2
Total		126	0	0.0	0	0	2

*Please note that non-sentinel specimens include all specimens referred to the NVRL, these specimens are mainly from hospitals and some GPs and may include more than one specimen from each case.

Mortality Data

No registered deaths have been attributed to influenza and reported to HPSC between weeks 21 and 25 2007.

Weekly Influenza Notifications

There were six influenza A notifications from HSE-MA and -MW during weeks 21-25 2007 reported to HPSC. Influenza cases notified to HPSC during the summer of 2006 and 2007 and during the 2006/2007 influenza season are shown in figure 3, and compared to ILI consultation rates.

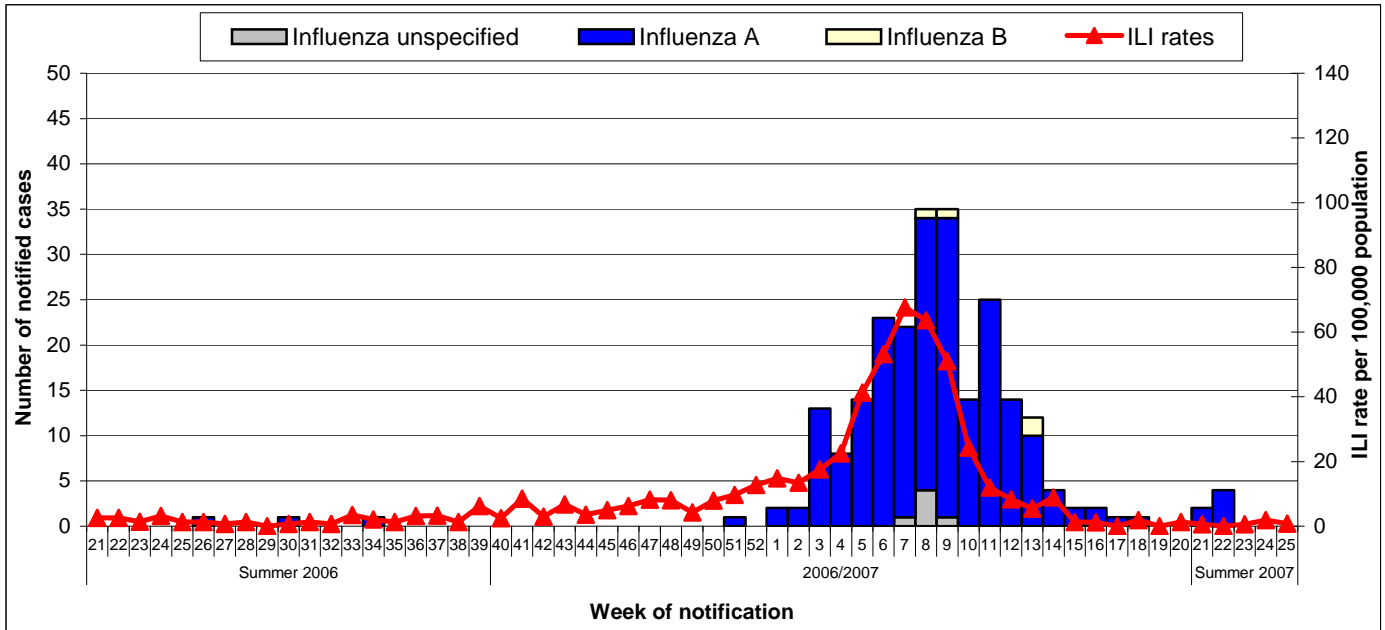

Figure 3: Number of notifications* of influenza (possible & confirmed) by type and by week of notification compared to sentinel GP ILI consultation rates per 100,000 population during the summer of 2006, 2006/2007 influenza season and summer 2007.

*Notification data are provisional and were extracted from [CIDR](#) on the 27/06/2007 at 16.40 GMT.

Further information on influenza can be found on the [HPSC website](#)

Acknowledgements

HPSC, ICGP, NVRL and the Departments of Public Health wish to thank the sentinel GPs, hospitals and schools who have participated in this surveillance system and who have contributed towards this report.
