

Summary Findings of Uptake of the Seasonal Influenza Vaccine in HSE-funded Hospitals and Nursing Homes and Other Disability Facilities in Ireland in 2012-2013 Compared to the Uptake in 2011- 2012

September 2013

Amended 21/03/2014

A Report by the Health Protection Surveillance Centre

Note erratum: on page 3 of this report, in the summary results the following point incorrectly referred to 2011-2012 data, this has now been corrected.

Influenza vaccine uptake in long term care facilities (LTCFs) 2012-2013

- There was variation in uptake by HSE region (range 9.6%- 22.5%) (now corrected to 2012-2013 data). The highest was reported in HSE North-East.

Summary and key points

This report relates to influenza vaccination uptake among HCWs in hospitals and long term care facilities for the 2012-2013 influenza season. Comparison is made with estimated uptake for the 2011-2012 season. Overall there was increased participation for the 2012-2013 survey. Nationally, uptake rates in general were stable or decreased in comparison to uptake rate reported for 2011-2012 season.

Influenza vaccine uptake in Hospitals 2012-2013

- 84.9% (45/53 known hospitals) participated in the 2012-2013 survey
- Nationally, influenza vaccine uptake among all categories of hospital HCWs was 17.4%
- There was variation in uptake by HSE region (range 10.1%- 27.8%). The highest uptake was reported in the HSE North-East.
- At national level, there was wide range in uptake by HSE category (12.5%-23.55), the highest uptake was reported in the category 'medical and dental' and lowest in 'Nursing'.

Table 1. Influenza vaccine uptake hospital HCWs, 2012-2013/2011-2012 seasons, by region/staff category

HSE Region	Season	
	2012-2013	2011-2012
Dublin Mid-Leinster	22.0	19.7
Dublin North-East	27.8	25.5
South	10.1	9.2
West	10.7	11.3
HSE Grade Category		
General Support Staff	22.1	21.6
Health & Social Care Professionals	20.0	25.1
Management & Admin	18.5	20.9
Medical & Dental	23.5	21.9
Nursing	12.5	12.2
Other Patient & Client Care	21.7	19.6
Total (All Staff)	17.4	18.0

Influenza vaccine uptake in long term care facilities (LTCFs) 2012-2013

- 89.3% (183/205 known LTCFs) participated in the 2012-2013 survey
- Nationally, influenza vaccine uptake among LTCF HCWs was 15.0%
- There was variation in uptake by HSE region (range 9.6%- 22.5%). The highest was reported in HSE North-East.
- At national level, there was wide range in uptake by HSE category (range 11.6%-22.6%). The highest uptake was in the management/administration category and lowest in Health & Social Care Professionals.

Table 2. Influenza vaccine uptake in LTCFs HCWs, 2012-2013,2011-2012 season, by region/ staff category

HSE Region	Season	
	2012-2013	2011-2012
Dublin Mid-Leinster	19.5	26.7
Dublin North-East	22.5	19.1

General Support Staff	17.7	17.1
Health & Social Care Professionals	11.6	19.7
Management & Admin	22.6	22.4
Medical & Dental	19.8	11.3
Nursing	14.8	16.4
Other Patient & Client Care	13.5	19.7
Total (All Staff)	15.0	18.0

Introduction

This report summarises the uptake of seasonal influenza vaccine amongst healthcare workers (HCWs) in HSE-funded hospitals and long term care facilities (LTCFs) (LTCFs included disability and mental health facilities and care for the elderly units) for the 2012-2013 influenza season. This is the second seasonal influenza vaccination uptake survey to be carried out by the HPSC. Each year HSE recommends that all HCWs in Irish health services should receive the seasonal influenza vaccination. Striving to achieve high uptake of influenza vaccination among HCWs is recognised as an important infection control intervention, to reduce the risk of influenza transmission between patients and HCWs with the potential for severe disease in patients and staff. However, in recent years in Ireland, influenza outbreaks in healthcare settings have occurred, the majority of which have been characterised with low uptake among HCWs working in these units.

Methodology

Survey forms were designed in MS-Excel and sent to hospitals and long term care facilities via the HSE Regional Directors of Operations (RDOs) twice during the influenza season (January 2013 and May 2013). Aggregate data was collected on the number of staff (one of six categories used by HSE: management and administration, medical and dental, nursing, health and social care professional, other patient and client care, general support staff) eligible for vaccination and the number vaccinated during the season.

For hospitals, occupational health departments provided data on the number and category of HCWs vaccinated by the service. The HR department provided data on the numbers of staff and community-based staff employed in the hospital by category.

In the long term care facilities, the number of staff vaccinated was provided either by senior management in these units or by the occupational health department which provided vaccination services. The number of staff employed by each facility during the influenza season was provided by senior management. For the long term care residential facilities, information was also sought on the number of residents and respite care patients present and vaccinated during this time period. For the analyses, aggregate end of season data were used for both hospitals and long-term care facilities. Statistical analysis was performed in MS-Excel.

Instructions on how to complete the forms, how to calculate the numerator (number vaccinated) and denominator (number eligible) of staff and clients, and a description of staff categories were included in protocols specifically developed for this project by the HSE partners (National Hospitals Office, representatives from occupational health physicians, National Immunisation Office (NIO) and the HPSC).

Results

Hospitals

Participation in survey

In the 2012-2013 season, a total of 53 known hospitals were eligible for inclusion in the analyses, 45 (84.9%) of which responded by submitting a return. Two surveys were conducted during the 2012-2013 season, 27 (60.0%) of participating hospitals provided provisional data in January and 33 (73.3%) in May. Fifteen (33.3%) hospitals submitted returns from both surveys. Where more than one return form was submitted by a hospital, only the most recent, end of season, set of figures

were used in the analyses. For those hospitals that submitted only one form, their data were also included in the analyses. In contrast, 54 hospitals in the 2011-2012 season were eligible for inclusion, 46 (85.2%) of which submitted a return (Figure 1).

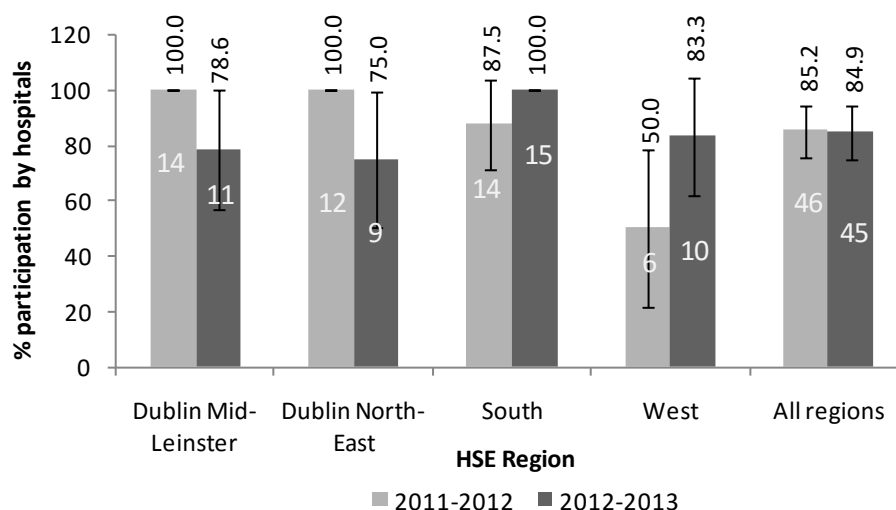

Figure 1. Number and percentage of eligible hospitals that participated in survey by HSE region in seasons 2011-2012 (n=54 total eligible) and 2012-2013 (n=53 total eligible) with 95% CIs

Hospital staff details

All 45 participating hospitals in 2012-2013 provided details of vaccinated staff numbers: 35 (77.8%) provided the required eligible staff number details needed to calculate the percentage uptake; 10 (22.2%) of the 45 hospitals provided whole time equivalent (WTE) values rather than the actual number of eligible staff*. In contrast, 41 of the 46 (89.1%) participating hospitals in 2011-2012 provided details of both eligible and vaccinated staff numbers.

Community-based staff vaccinated by occupational health details

In 2012-2013, 11 (24.4%) of the 45 participating hospitals provided details of vaccinated community-based staff numbers, of which three (6.7%) provided details of the eligible community staff numbers needed to determine uptake. In contrast, two out of 46 hospitals (4.3%) in 2011-2012 provided details of vaccinated community staff numbers, of which one (2.2%) also had details of eligible community staff numbers.

Hospital staff vaccine uptake by HSE region

Overall, the percentage uptake by all hospital staff fell to 17.4% (95%CI 17.1-17.8) in 2012-2013 from 18.0% (95%CI 17.6-18.3) in 2011-2012, a between seasonal difference that was statistically significant (Z score=1.98; P=0.0239). Uptake improved slightly in three of the four regions. The highest uptake in both seasons was in Dublin North-East with the lowest in the South. Even though the South had the lowest staff uptake, it is worth noting that the number of hospitals that provided complete uptake figures (i.e. with both eligible and vaccinated staff details available), particularly

* These hospitals were identified by their returns that included figures with decimal values rather than integers and were therefore assumed to have provided WTE data.

during the 2012-2013 season, was also highest in the South. In contrast, the number of hospitals providing complete uptake figures in Dublin Mid-Leinster and Dublin North-East fell markedly (Figure 2).

Compared to the national uptake level in both seasons, the percentage uptake among hospital staff was significantly higher in Dublin Mid-Leinster and Dublin North-East and significantly lower in the South and West regions (Figure 2).

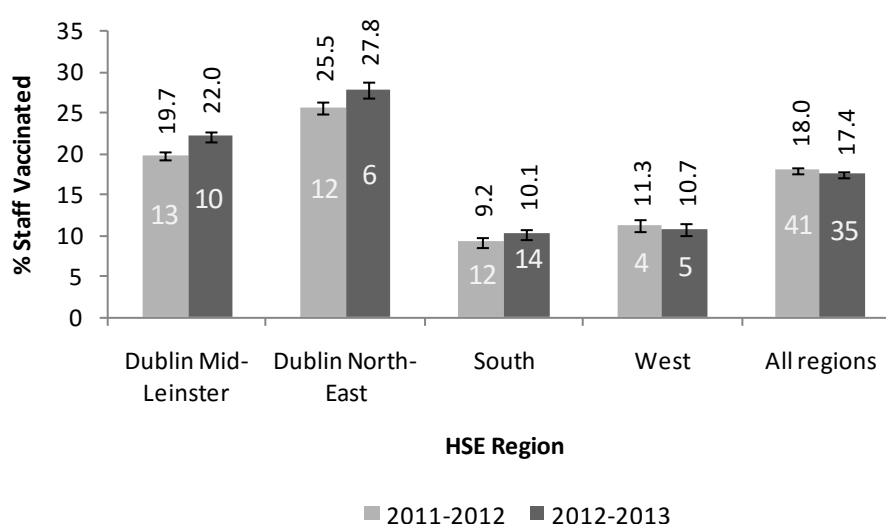

Figure 2. Percentage uptake of the seasonal influenza vaccine by hospital staff with 95% CIs and number of hospitals that provided details of both eligible and vaccinated staff numbers in seasons 2011-2012 (n=41 hospitals) and 2012-2013 (n=35 hospitals)

When comparing only hospitals that provided details of eligible and vaccinated staff numbers in both the 2011-2012 and 2012-2013 seasons, a total of 29 hospitals were identified. Seven out of these 29 hospitals (24%) increased their staff vaccination uptake by 2% or more between seasons; no hospital increased their uptake by more than 10%.

Hospital staff vaccine uptake by grade

In those hospitals where both eligible and vaccinated staff numbers were available (n=29), increased uptake between seasons was evident in some staff categories: general support staff (+0.5%); medical and dental staff (+1.6%); nursing (+0.3%); and other patient and client care professionals (+2.1%). However none of these increases were statistically significant (Figure 3, Appendix 1). Reductions in uptake were observed among health and social care professionals (-5.1%) and among management and administration staff (-2.4%), both of which were statistically significant (Figure 3, Appendix 1).

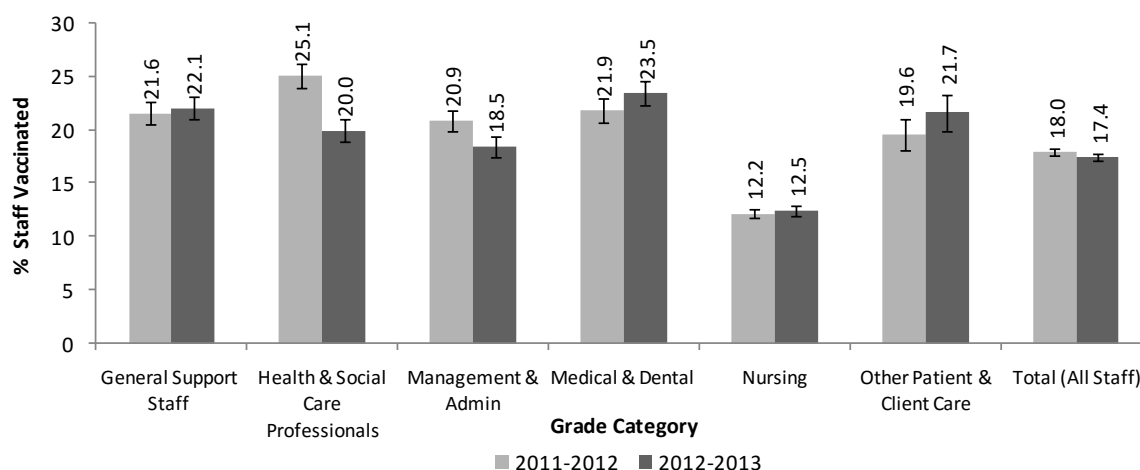

Figure 3. Percentage uptake of the seasonal influenza vaccine in hospitals (n=29) by HSE grade category in the 2011-2012 and 2012-2013 seasons with 95% CIs (excludes hospitals that had null returns for either eligible or vaccinated staff numbers or both)

Uptake in community-based staff vaccinated by occupational health

Information received on the uptake of the vaccine among community-based hospital staff was minimal in 2012-2013 with three hospitals providing details, two of which provided details of both eligible and vaccinated staff numbers (Appendix 2). This was a slight improvement on the previous 2011-2012 season when only one hospital provided this information.

Long-term care facilities (Nursing Homes, mental health and other disability facilities)

Participation in survey

A total of 205 known nursing homes, mental health and disability facilities were eligible for inclusion in the survey, of which 183 (89.3%) responded by submitting a return. Two surveys were conducted during the season, 98 (53.6%) of the participating facilities provided provisional data in January and 146 (79.8%) in May. Sixty-one (33.3%) facilities submitted returns from both surveys. Where more than one return form was submitted by a facility, only the most recent, end of season, set of figures were used in the analyses. For those facilities that submitted one form only, their data were also included in the analyses. In contrast, 157 facilities in the 2011-2012 season were eligible for inclusion, of which 120 (76.4%) submitted a return (Figure 4).

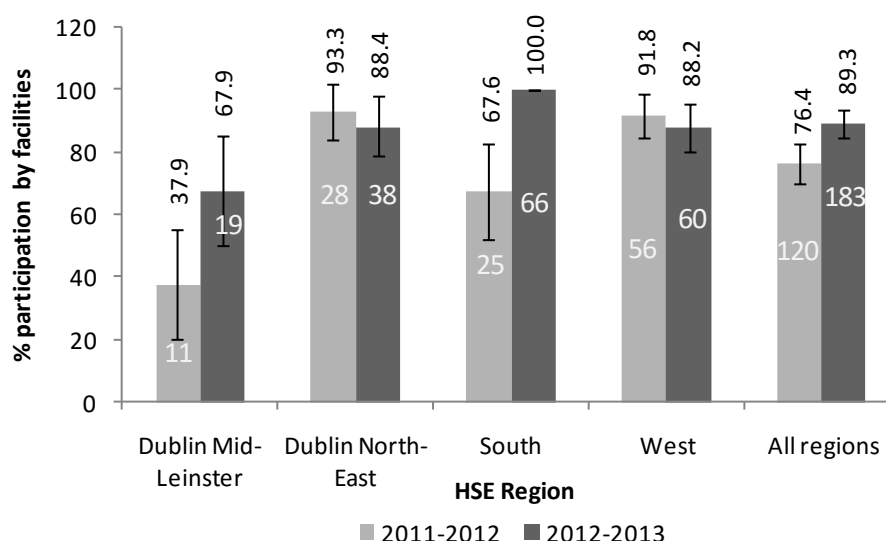

Figure 4. Percentage and number of eligible long-term care facilities that participated in survey by HSE region in seasons 2011-2012 (n=157 total eligible) and 2012-2013 (n=205 total eligible) with 95%CI

A total of 183 facilities participated in the 2012-2013 season compared to 120 in the 2011-2012 season, an increase of 52.5%, most of which can be attributed to increased participation by mental health and other disability units. Among the 205 eligible facilities in 2012-2013, 41 (22.4%) were mental health or other disability units, of which 38 (92.7%) submitted a return. Eleven of these 38 facilities (28.9%) submitted a provisional return in January and 35 (92.1%) an end of season return in May; eight (21.0%) submitted returns on both occasions.

Facility staff and patient resident details

In 2012-2013, details of eligible staff numbers were provided by 157 of the 183 (85.8%) participating facilities; 137 (74.9%) of which also provided the required vaccinated staff number details necessary to calculate the percentage uptake of the vaccine. Four (1.1%) of the 183 facilities provided WTE values rather than the actual number of eligible staff. Of the participating facilities, 168 (91.8%) submitted information on either long term or respite residents or both. In contrast, in 2011-2013 details of eligible staff numbers were provided by 90 facilities, of which 70 (77.8%) also provided the required vaccinated staff number details.

Facility staff vaccine uptake by HSE region

Overall, the percentage uptake in 2012-2013 by all staff (in hospitals that provided both eligible and vaccinated staff numbers only) fell from 18.0% (95%CI 16.9-19.1) in 2011-2012 to 15.0% (95%CI 14.4-15.6) in 2012-2013, a between seasonal difference that was statistically significant (Z score=4.96; $P<0.00001$) (Figure 5). Uptake improved in one region (Dublin North-East). The highest uptake in both seasons was in Dublin North-East and Dublin Mid-Leinster. Even though the South had the lowest staff uptake in 2012-2013, this region had the highest number of facilities providing complete uptake figures, increasing from 13 during the previous season to 45 in the latest (Figure 5, Appendix 3).

Compared to the national uptake level in both seasons, the percentage staff uptake in facilities was significantly higher in Dublin Mid-Leinster and significantly lower in the South and West regions (Figure 5, Appendix 3).

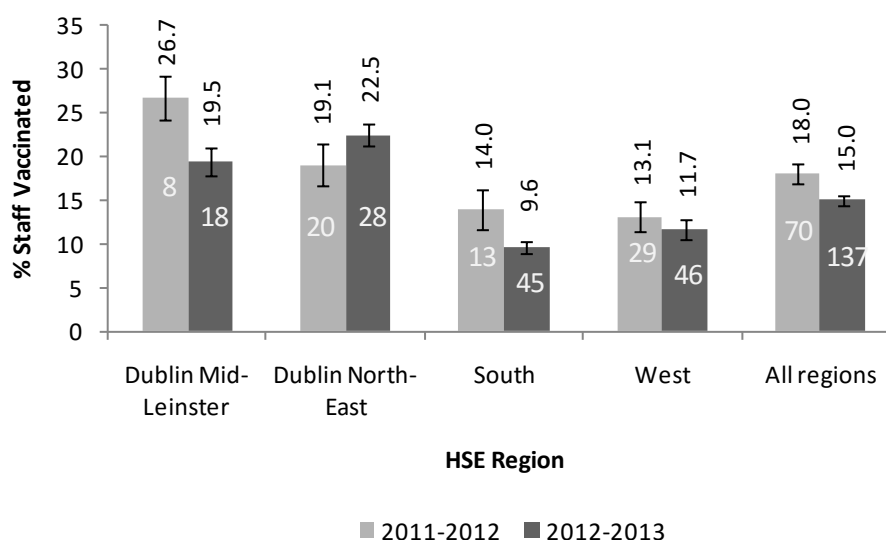

Figure 5. Percentage uptake of the seasonal influenza vaccine by facility staff with 95% CIs and number of long-term facilities that provided details of both eligible and vaccinated staff numbers in seasons 2011-2012 (n=70 facilities) and 2012-2013 (n=137 facilities)

Facility staff vaccine uptake by grade

Among the grade categories, three exhibited an improved uptake between seasons, but none were statistically significant: general support staff (+0.5%), management and administration (+0.2%), and medical and dental staff (+8.4%) (Figure 6, Appendix 3). Reductions in uptake were observed among health and social care professionals (-8.1%) and nursing staff (-1.7%) with the decline being statistically significant among the former group.

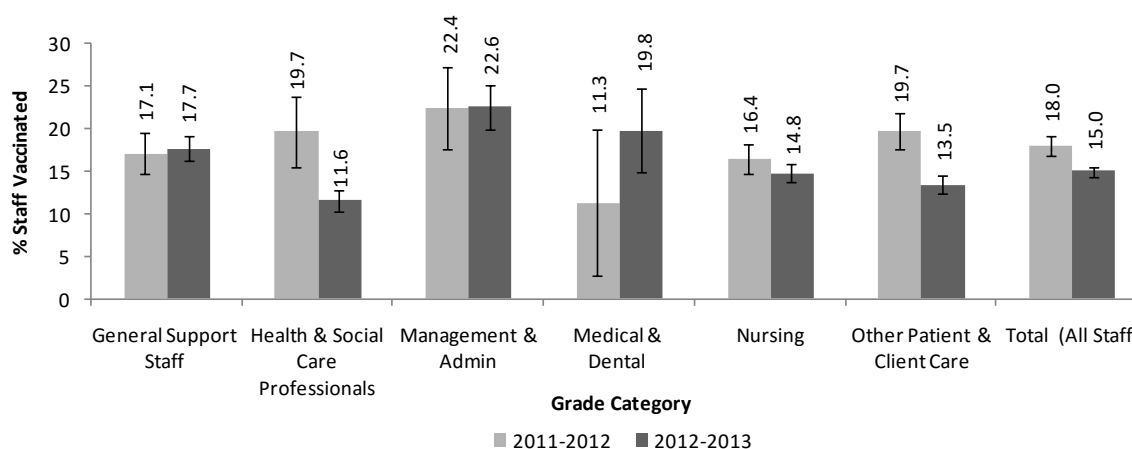

Figure 6. Percentage uptake of the seasonal influenza vaccine in long-term care facilities by HSE staff grade category in seasons 2011-2012 and 2012-2013 with 95% CIs (excludes those units that had null returns for either eligible or vaccinated staff numbers or both)

Vaccine uptake among long-stay and respite residents

As shown in Table 1, the sharp increase in the number of participating facilities between the 2011-2012 and 2012-2013 seasons (280%) resulted in a marked increase (17.6%) in the total number of long-stay beds included in the survey results, and an increase in the number of long-stay residents reported on the day the survey was conducted locally (40.5%) and during the entire influenza season (40.8%). Long-stay residents who were discharged or died over the course of each influenza season also increased by 21.6% between seasons (Table 1). Also between seasons, the percentage of long-stay residents vaccinated on the day of the survey was conducted locally fell from 85.4% to 78.7% and, over the course of each season from 88.3% to 73.0% (Table 1).

In contrast, the number of respite beds increased marginally by 5.4% between seasons, but the actual number of respite residents reported on the day the survey was conducted and also over the course of each influenza season declined by 3.2% and 14.3%, respectively (Table 1). The number of respite residents vaccinated before admission however, increased by 182% between seasons, and the percentage of respite residents vaccinated over the course of each season changed from 3.1% to 6.3% (Table 1).

Table 1. Details of the numbers of long-stay and respite beds and residents in participating facilities during 2011-2012 and 2012-2013 seasons

	Season		% Change
	2012-2013	2011-2012	
Total No. Participating Facilities	183	120	52.5%
No. Mental Health and Other Disability Participating Facilities	38	10	280%
No. Long Stay Beds	5701	4849	17.6%
No. Long Stay Residents Reported on Date of Report	6356	4524	40.5%
No. Long Stay Residents Vaccinated on Date of Report	5001	3864	29.4%
% Long Stay Residents Vaccinated on Date of Report	78.7%	85.4%	-6.7%
No. Long Stay Residents Reported Since Season Start	6503	4619	40.8%
No. Long Stay Residents Vaccinated Since Season Start	4746	4078	16.4%
% Long Stay Residents Vaccinated Since Season Start	73.0%	88.3%	-15.3%
No. Long Stay Residents Discharged/Died Since Season Start	811	667	21.6%
No. Respite Care Beds	549	521	5.4%
No. Respite Residents Reported on Date of Report	485	501	-3.2%
No. Respite Residents Vaccinated Before Admission	449	159	182.4%
No. Respite Residents Reported Since Season Start	4790	5591	-14.3%
No. Respite Residents Vaccinated Since Season Start	303	172	76.2%
% Respite Residents Vaccinated Since Season Start	6.3%	3.1%	3.2%

In 2012-2013, 6.0% (n=11/183) of facilities reported having a policy recommending the seasonal influenza vaccine for respite care patients and 4.4% (n=8/183) for agency staff; these figures were a small improvement on that which was reported for the previous season (Table 2). Information on a policy of facility staff being vaccinated was not collected during the 2011-2012 season, but in 2012-2013 the percentage of facilities with such a policy was 5.5% (n=10/183) (Table 2). Two (1.1%) facilities during the 2012-2013 season had all of the above three policies in place.

Table 2. Details of the percentage of participating facilities with vaccination policies in place for facility staff (including agency staff) and respite residents during 2011-2012 (n=120) and 2012-2013 (n=183) seasons

	Season			
	2012-2013		2011-2012	
Vaccination policy question	n	% of All 183 participating facilities	n	% of All 120 participating facilities
<i>'Is there a policy that all elective respite residents should be vaccinated prior to admission?' Yes</i>	11	6.0%	5	4.2%
<i>Is there a policy that all staff should be vaccinated? Yes</i>	10	5.5%	n/a	n/a
<i>'Does your unit require that agency staff should be vaccinated prior to working in the service?' Yes</i>	8	4.4%	1	0.8%

Note: n/a data not collected in 2011-2012 season

Discussion

The findings of this second annual survey on influenza vaccination uptake among HCWs working in HSE hospitals and long term care facilities paint a picture of contrasts. Notable improvements since the 2011-2012 survey include the increased participation by LTCFs (53%), especially in the Southern region, and an increase (from 3% to 6%) in the percentage of respite residents vaccinated.

However, declines in uptake were observed between 2011-2012 and 2012-2013 among staff in LTCFS from 18% to 15%, and a small decline was found in hospitals from 18% to 17%. In addition, the percentage of long stay residents vaccinated in the 2012-2013 season was 73%, considerably less than the 88% reported during the previous season.

These reductions occurred against a background when considerable efforts were made by NIO and HPSC and others to highlight the importance of seasonal influenza vaccination for both staff and patients. The absence of vaccination policies in LTCFs, despite national recommendations is also of concern³.

The uptake figures reported here compare favourably with some and unfavourably with other countries that monitor uptake in HCWs. For example, in England during the 2012-2013 season, 45.7% of all frontline HCWs (from all NHS trusts) with direct patient care received the seasonal influenza vaccine (an increase in uptake compared with 44.6% during the in 2011-2012 season.¹ However, as our survey sought information on all HCWs employed in the hospitals and LTCFS (and was not limited to frontline HCWs) the HCW population in the UK is not completely comparable to those in our survey. In comparison to other European countries Ireland was one of relatively few countries that was able to provide data uptake in a recent European survey (2011-2012 data), with the majority of EU countries not able to provide data on HCW uptake.² In this EU funded study ten countries provided data on HCW influenza uptake, ranging from 6.4% (Poland) to 54.4% (Romania). From this study it is evident that recommendations and requirements for HCW vaccination differ somewhat across Europe, although all recommend influenza vaccine for this work group.

Possible limitations of the estimates of influenza uptake presented here include incomplete data relating to staff numbers of those eligible and vaccinated in participating hospitals (78% of hospitals and 75% of LTCFs provided the data needed to calculate uptake for the 2012-2013 survey). In addition, a small number of units provided WTE details during the 2012-2013 season rather than

actual numbers of staff (as requested in the circulated protocols), thereby potentially inflating reported uptake figures.

Another possible limitation of these estimates is the assumption that the data provided by all occupational health departments (hospitals) and LTCF management accurately reflects uptake of HCWs employed in their units. Such information may underestimate the uptake if substantial numbers of HCWs are vaccinated outside the occupational health service. However, although some staff may seek influenza vaccination from a GP or local pharmacy (for convenience purposes) we consider the likelihood of this to be low as costs would normally be incurred to the HCWs in these settings.

In the LTCF setting, the data reported by the LTCFs was based on data available to the person completing the survey. Obtaining accurate uptake data may have been more difficult in LTCFs in the absence of standard data collation system, particularly if the service provided was not on site. However, national guidance does recommend that all LTCFs should collect data on staff immunisation annually.³

In the international literature there is growing evidence of strategies that can improve uptake including: improved access to vaccination clinics (e.g. through mobile units operating on-site, in the wards for all shifts); improve knowledge and attitudes to vaccination; timely reminders; incentives; assigning dedicated personnel to support the vaccination programme.^{2,4} The use of performance indicators to monitor and encourage uptake is currently under discussion within the HSE as a means to improve data reporting and monitor trends.

In order to gain greater insight into the challenges faced by both hospitals and long-term care facilities into achieving high uptake levels, the HPSC is currently conducting a survey with HSE facilities, the results of which will be made available before the end of the 2013.
